## GREEK.

*General locality.*—Eastern shore of Cox Creek on a point about 2¾ miles north of Eastern Bay and ½ mile east of entrance to Warehouse Creek. (See Chart No. 31.)

*Immediate locality.*—Observed station is on a marsh point about 1 foot above high water, 60 yards southwest of extreme end of point, and 125 yards east of a small marsh island.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 5 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## TURKEY.

*General locality.*—Northern shore of Eastern Bay on southern end of Cox Neck on Turkey Point about 1 mile west of the north end of Bodkin Island. (See Chart No. 31.)

*Immediate locality.*—Observed station is in marsh meadow about 2 feet above high water, 40 yards northeast of shore, 200 yards south of a group of three pine trees near shore, and in center of triangle formed by three pine stubs driven flush with marsh to support theodolite.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 6 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## COX.

*General locality.*—Western shore of Crab Alley Bay on Cox Neck about  $\frac{3}{8}$  mile north of Eastern Bay and 1 mile northwest of Bodkin Island. (See Chart No. 31.)

*Immediate locality.*—Observed station is at edge of a cultivated field on narrow neck of land about 3 feet above high water, 16 yards west of shore, 18 yards east of shore, and 80 yards northwest of extreme end of point.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 4 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## NEEDLE.

*General locality.*—Northern part of Eastern Bay on Bodkin Island at entrance to Crab Alley Bay about 1 $\frac{1}{2}$  miles west of the south end of Parsons Island and 1 mile east-southeast of Turkey Point. (See Chart No. 31.)

*Immediate locality.*—Observed station is near south end of Bodkin Island about 12 feet above high water, 50 yards north by west of shore, 90 yards northeast by east of shore, 115 yards west-southwest of shore, and in center of radial lines of sight cut in bushes.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 4 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## KEMP TOWER.

*General locality.*—Southern shore of Eastern Bay on Wades Point about 1 mile southwest of Claiborne Wharf and 5½ miles east of Bloody Point Bar Light. (See Chart No. 31.)

*Immediate locality.*—Observed station is on tower or cupola of Wades Point Hotel, which is a large square frame structure adjoining a brick house.

*Marks.*—Observed station is center of top of roof of cupola.

*References.*—None necessary.

## KEMP.

*General locality.*—Southern shore of Eastern Bay on Wades Point about 1½ miles southwest of Claiborne Wharf and 4¾ miles east by south of Bloody Point Bar Light. (See Chart No. 31.)

*Immediate locality.*—Observed station is in cultivated land about 8 feet above high water, 30 yards east by north of a wire fence and several trees, 55 yards south-southeast of edge of bank, 90 yards east-northeast of a bungalow, 130 yards north by west of a wire and wood fence corner, 130 yards north-northwest of wooden fence, and 400 yards west by south of Wades Point Hotel.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 6 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## RICH NECK WATER TANK.

*General locality.*—On neck of land about halfway between Eastern Bay and Miles River, about 1¾ miles south-southwest of Tilghmans Point. (See Charts Nos. 31 and 32.)

*Immediate locality.*—Observed station is on large water tank on steel tower on Rich Neck Farm.

*Marks.*—Observed station is spindle on center of water tank.

*References.*—None necessary.

## OVER.

*General locality.*—Eastern shore of Crab Alley Bay on a point about 1¼ miles north-northwest of Normans Point. (See Chart No. 32.)

*Immediate locality.*—Observed station is on edge of a cultivated field near a number of locust and wild cherry trees, about 3 feet above high water, 11 yards northeast of shore, 50 yards southeast of end of a marsh point, and 4 yards north of corner of a rail fence.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 3 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

*References.*—

## NORMAN.

*General locality.*—Eastern shore of Crab Alley Bay on southwestern extremity of Crab Alley Neck about ¼ mile west of Normans Point, 2 miles northeast of Turkey Point, and ¾ mile northwest of Parsons Island. (See Chart No. 32.)

*Immediate locality.*—Observed station is in a cultivated field on a rapidly washing, narrow neck of land, about 6 feet above high water, 20 yards north of vertical bank at shore, 30 yards south of vertical bank at shore, and 40 yards northeast of extreme end of point.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 3 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

PARSONS.

*General locality.*—In northern side of Eastern Bay on western side of Parsons Island about 3 miles north of Tilghmans Point. (See Chart No. 32.)

*Immediate locality.*—Observed station is in cultivated land on highest part of island about 15 feet above high water, 110 yards southeast of shore, 270 yards south-southwest of Parsons Island Water Tank, 350 yards southwest of a house, 380 yards west-southwest of a large barn, 145 yards northeast of a wire fence, 155 yards northwest of wire fence at farm road, 195 yards southeast of a fence, and on the range of the west edge of the south chimney on the lower gable of the house with the west side of a window in the center of the south side of the house. Cement monument marking reference station is 26.10 meters N 21° 43' E of observed station.

*Marks.*—Observed station is center of cross cut on rough granite stone about 35 inches long and 12 inches square with top cut to 6-inch cube and marked "U S" in lower half of cross. Subsurface mark is the mouth of a bottle 3 inches below base of monument. Reference station is center point of triangle on standard cement monument with top 5 inches above the surface of the ground.

PARSONS ISLAND WATER TANK.

*General locality.*—Northern part of Eastern Bay between Crab Alley and Prospect Bays on Parsons Island, about halfway between the north and south end of the island. (See Chart No. 32.)

*Immediate locality.*—Observed station is on a water tank on wooden structure near a house.

*Marks.*—Observed station is center of spindle on center of water tank.

*References.*—None necessary.

ALLEY.

*General locality.*—Western shore of Prospect Bay on Crab Alley Neck about ¾ mile north of Parsons Island and ⅜ mile north of Narrows Point. (See Chart No. 32.)

*Immediate locality.*—Observed station is on hard ground in a marsh at northeast end of clump of 12 persimmon trees about 1 foot above high water and 75 yards southwest of point.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 5 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

#### NEW BARN CUPOLA.

*General locality.*—Western shore of Prospect Bay on Crab Alley Neck about 1¼ miles north-north-west of Parsons Island. (See Chart No. 32.)

*Immediate locality.*—Observed station is spindle with weather vane on cupola of barn about 100 yards east-southeast from house on farm belonging to H. C. Norman.

*Marks.*—Observed station is spindle on cupola.

*References.*—None necessary.

#### DULL.

*General locality.*—Western shore of Prospect Bay on a point at northern side of entrance to a cove about 2½ miles south of Kent Narrows railroad bridge, ⅔ mile west-southwest of Hoods Point and 1¼ miles north of Narrows Point. (See Chart No. 32.)

*Immediate locality.*—Observed station is in marsh land about 1 foot above high water, 30 yards west of shore, 40 yards northeast of shore, and 80 yards north-northwest of extreme end of point.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 4 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

BONNET.

*General locality.*—Eastern shore of Prospect Bay on Hood Point about  $1\frac{1}{2}$  miles southeast of Hog Island and  $\frac{1}{2}$  mile west of Piney Point. (See Chart No. 32.)

*Immediate locality.*—Observed station is on marsh ground about 1 foot above high water, 21 yards west of shore, 12 yards west of inlet, and 55 yards northeast of the extreme end of Hoods Point.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 6 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## JUNE.

*General locality.*—On Wye Island on eastern shore of the branch of Wye River bounding Wye Island on the west on a point at northern side of entrance to a cove about ¼ mile southwest of entrance to Wye Narrows. (See Chart No. 32.)

*Immediate locality.*—Observed station is on a marsh point about 1 foot above high water, 10 yards south-southeast of shore, 20 yards southwest of lines of trees and marsh, and 50 yards north of twin oak trees.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 4 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

Nail in blaze in chestnut stump with second growth (14 inches diameter).....	279	53	10	..... 12.93 meters.

## GO.

*General locality.*—On Wye Island on the northern shore of the branch of Wye River bounding Wye Island on the south, on a point between two coves about  $\frac{1}{4}$  mile west of entrance to Dividing Creek. (See Chart No. 32.)

*Immediate locality.*—Observed station is on grassy beach at high water, about 2 yards south of foot of bank 4 feet high covered with dense growth of young trees, and 37 yards from entrance to a small creek. Cement monument marking reference station is 19.06 meters N 22° 35' E of observed station.

*Marks.*—Observed station is nail in center of 2-inch pine stub projecting 2 inches above 2-inch tile pipe with top 2 inches below surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of surface pipe. Reference station is center point of triangle on standard cement monument projecting 4 inches above surface of ground.

## PHILIP.

*General locality.*—On Wye Island on the northern shore of the branch of Wye River bounding Wye Island on the south, on western side of entrance to Granary Creek and ½ mile east of entrance to Dividing Creek. (See Chart No. 32.)

*Immediate locality.*—Observed station is about 1 foot above high water, 3 yards north of shore, 9 yards south-southwest of shore of creek, 9 yards west of extreme end of point, and 6 yards southeast of point of bank 4 feet high. Cement monument marking reference station is 4.62 meters N 18° 12' E of observed station.

*Marks.*—Observed station is nail in center of 2-inch cedar stub projecting 2 inches above 2-inch tile pipe with top flush with surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of surface pipe. Reference station is center point of triangle on standard cement monument projecting 4 inches above surface of ground.

## SYLVIA.

*General locality.*—Southeastern shore of the branch of Wye River bounding Wye Island on the south on second prominent point north of entrance to Lloyd Creek. (See Chart No. 32.)

*Immediate locality.*—Observed station is in a cultivated field about 10 feet above high water, 11 yards east by south of edge of bluff, 22 yards northeast of lone locust tree 2 feet in diameter at the edge of the bank, and 400 yards northwest of a large barn.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 5 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## COLONEL.

*General locality.*—Southern shore of Shaw Bay on a point at entrance to a small cove about 1/2 mile from the branch of Wye River bounding Wye Island on the south and 5/8 mile east of Bruffs Island. (See Chart No. 32.)

*Immediate locality.*—Observed station is in a field about 10 feet above high water, 6 yards southeast of edge of bank which is washing away, 9 yards south-southwest of point of bank, and 3 yards west of top of bank lined with cedar, walnut, and oak trees. Cement monument marking reference station is 18.69 meters S 24° 06' E of observed station,

*Marks.*—Observed station is nail in center of 2-inch stub projecting 4 inches above 2-inch tile pipe with top flush with surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of surface pipe. Reference station is center point of triangle on standard cement monument projecting 4 inches above surface of ground.

## BOUNDARIES OF OYSTER BARS.

### EXPLANATION.

The law of the United States authorizing the cooperation of the Department of Commerce and Labor in the survey of natural oyster bars of Maryland provides for the designation and employment by the Department of Commerce and Labor of such officers, experts, and other technically qualified persons "as may be necessary to cooperate with the Maryland State Board of Shell Fish Commissioners in making a survey of and locating the natural oyster beds, bars, and rocks in the waters within the State of Maryland." The oyster laws of Maryland provide that the Maryland Shell Fish Commissioners, with the aid of such persons as may be designated by the Government, shall proceed "to have laid out, surveyed, and designated on the said charts the natural beds and bars, and shall cause to be marked and defined as accurately as practicable the limits and boundaries of the natural beds, bars, and rocks as established by said survey, and they shall take true and accurate notes of said survey in writing, and make an accurate report of said survey, setting forth such a description of landmarks as may be necessary to enable the said board, or their successors, to find and ascertain the boundary lines of the said natural oyster beds, bars, and rocks, as shown by a delineation on the maps and charts." The oyster laws of Maryland also provide in another section that there shall "be made a true and accurate survey of the natural oyster beds, bars, and rocks \* \* \* with reference to fixed and permanent objects on the shore, giving courses and distances, to be fully described and set out in a written report of said survey."

Under the provisions of the laws quoted above the State of Maryland, in cooperation with the Department of Commerce and Labor, must define the boundaries of the natural oyster bars "as accurately as practicable" and also "with reference to fixed and permanent objects on the shore, giving courses and distances." The requirement of "as accurately as practicable" is easily fulfilled by definition of the location of the corners of the oyster bars by latitude and longitude. In fact, this method is probably the most satisfactory and accurate one that could be used for all purposes of legal definition or for relocation of the oyster-bar boundaries by competent engineers. Therefore the additional requirement of "giving courses and distances" is superfluous and is only fulfilled in the published definitions on account of the specific provisions of the law making it compulsory. This part of the description of boundaries has involved an immense amount of extra computations in order to prevent technical discrepancies between the latitude and longitude of a corner of an oyster bar and its distance and bearing from objects on shore of known latitude and longitude without adding anything to the accuracy and very little to the convenience of practical use of the descriptions of the oyster-bar boundaries.

As provided by law the boundaries of the oyster bars are all straight lines, but in the work already completed they have inclosed areas of all shapes from triangles to complicated 14-sided figures, and of all sizes from 4 acres to 7,548 acres. The sides have varied in length from 93 to 7,529 yards, and in some cases the corners of the boundaries have been practically at the triangulation stations from which they are located, while in other instances they were over 13,600 yards from the landmarks most available for the purpose of fixing their position.

The varied characteristics of the legal boundaries of the oyster bars indicated by the above statement, together with the complicated requirements of the law under which the survey has been made and the magnitude of the work with the consequent need of fixed and uniform methods, have made the problem of describing the boundaries one of considerable difficulty and great importance.

The boundaries of the oyster bars of Maryland, as established by the Shell Fish Commission and delineated on the Coast and Geodetic Survey charts and projections and on the leasing charts of the commission, are technically defined and described by a method somewhat different from that used in other oyster surveys. But it is believed that the forms finally adopted will fulfill all needs of the survey for both the present and the future.

#### METHOD OF DESCRIBING BOUNDARIES.

The descriptions have been arranged in tabular form, thus avoiding many hundred repetitions of the same words by making one explanation of the tables sufficient for all oyster bars in each county.

*Title.*—At the top of each tabular form is given the legal name of the oyster bar to be described, and the one by which it is known and designated in the published oyster records and on the oyster charts. The adopted name of the oyster bar is the one used locally, as nearly as could be ascertained by the hydrographic engineer of the commission; and when there was no local name in common use a name was selected from one of the prominent features of the vicinity that would naturally suggest the section of the waters where the oyster bar was located.

Underneath the name, in parentheses, is given the general locality of the oyster bar and the serial number of the "Maryland Oyster Chart" on which its legal boundaries are shown.<sup>1</sup>

*First column.*—This column, under the heading of "Corner of bar," gives the number corresponding to the corner of the boundary as shown on the charts and to the number on the buoy marking the actual corner of the bar. The numbers of the corners have been assigned by naming the southernmost point No. 1, thence proceeding in a clockwise direction around the bar. Where a corner of one oyster bar is identical with the corner of the boundaries of one or more other oyster bars, only the number of the corner of the oyster bar being described in the table is given in this column.

*Second and third columns.*—These two columns, under the headings of "Latitude" and "Longitude," give the geographic positions of the corners. These positions have been adopted by the commission as the primary technical definition of the location of the corners, and should be considered as final in case of a dispute arising from discrepancies caused by other means of location. The latitudes and longitudes given in these

<sup>1</sup> These charts can be obtained by application to the Superintendent of the Coast and Geodetic Survey at Washington, D. C.

columns are based on the United States standard datum of the Coast and Geodetic Survey, and the points thus defined can be relocated from distant triangulation stations of the survey, even though all the landmarks and buoys originally used for their location have been destroyed by natural or other causes.

*Fourth and fifth columns.*—These two columns, under the general heading of "True bearing"<sup>1</sup> and the specific headings "Forward" and "Back," give bearings measured from a true north-and-south line. The three "Forward" bearings are from the corner of the boundary designated in the first column to the triangulation stations named on the corresponding lines in the last column, and the three "Back" bearings are from these same stations in the last column to the corresponding corner of boundary in the first column. The difference in minutes of arc between the forward and back bearings shown in some cases is actual and not accidental, and is due to the fact that the computations took into account the spheroidal shape of the earth.

*Sixth column.*—This column, under the heading of "Distance," gives the three computed distances in yards from the corner of the bar noted in the first column to the three triangulation stations named on the corresponding lines in the last column, and vice versa.

*Seventh column.*—This column, under the heading of "U. S. C. & G. S. triangulation station,"<sup>2</sup> gives the names of the landmarks from which were computed the corresponding "Latitude," "Longitude," "True bearing," and "Distance" of the "Corner of the bar" designated in the first column. A full description of the location and markings of these triangulation stations is given in another part of this publication under the heading of "Descriptions of triangulation stations."

#### SURVEYING METHODS FOR RELOCATION OF BOUNDARIES.

There are a number of methods that can be used in the relocation of the actual boundaries of the natural oyster bars as technically described in this publication and delineated on the published charts of the Coast and Geodetic Survey and the leasing charts of the Shell Fish Commission.

The following brief descriptions of five of these more or less different methods assume a certain amount of experience and knowledge on the part of the engineer in the particular kind of surveying under consideration, and are only intended as reminders of ways and means that can be used.

There are two problems that are likely to present themselves to those interested in the boundaries of natural oyster bars: One, to determine whether the buoys marking the corners have been dragged or otherwise moved from their correct positions, and the other, to relocate or reestablish a buoy at the point from which it was removed. The different ways of solving these two problems partly depend upon the instruments possessed by the engineer and his assistants and partly on his training and experience.

(1) *Triangulation.*—This method is the one that will give the greatest accuracy, but on account of its requiring special data and instruments, and being an operation rarely used by engineers not engaged in geodetic surveying, it is recommended only for

<sup>1</sup> The mean magnetic variation for Queen Annes County was 6° 15' west of north in 1911 and increasing at the rate of 5' yearly.

<sup>2</sup> Geographic positions of these triangulation stations can be obtained by application to the Superintendent of the Coast and Geodetic Survey, Washington, D. C.

cases in dispute that can not be settled satisfactorily by some other method. An explanation of this class of work would be too long for a report of this sort, and those not familiar with this method are referred to the publications on the subject by the Coast and Geodetic Survey.

(2) *Hydrographic.*—This method is the most simple and satisfactory one that can be adopted if the surveyor can obtain the use of the necessary instruments and assistants. It is the one best suited for the work of the engineers of the commission in relocating corners of boundaries, as it gives results of the accuracy ordinarily required and is rapid in execution. Besides, it has the advantage of being available whenever three triangulation stations of suitable relative positions are visible from the offshore points needing relocation.

Most navigators and others familiar with the use of a sextant are well acquainted with the graphic three-point method of fixing a position on water, and only a brief description of the operation will be stated.

In the case where there is only one engineer having a single sextant, the three-point method can be used if the two angles determining the position of a buoy are first derived from the "Forward" bearings given in the tabular forms describing the boundaries of the oyster bars. For example, take "Broad Creek" oyster bar, which is the first one described in this publication, and assume that "Corner No. 3," is to be examined as to its position. The angle between the two landmarks "Sandy Point Light" and "Ring" as determined from right to left from the forward bearings from this corner is  $98^{\circ} 09'$  and the angle between "Ring" and "Railway Water Tank" is  $71^{\circ} 08'$ . Having these two angles, the engineer proceeds to the buoy of doubtful location and measures the actual sextant angles between the landmarks for which the calculations were made. If the measured and calculated angles do not agree the buoy is not in its correct position and the boundary corner must be relocated. This is accomplished by moving the boat about until a point is reached where the angles do agree, and this point being the desired location, the buoy can be placed in its correct position.

If the engineer can obtain the use of both a sextant and a three-arm protractor ("position finder"), the availability of the hydrographic method is increased, as the use of the protractor is essential in case of the washing away or destruction of one or more of the landmarks originally used in describing the boundaries. Under these circumstances, any three landmarks of suitable relative position that are visible from the point to be located can be utilized. For example, the engineer can proceed to the buoy of doubtful position and measure the two adjacent sextant angles between the three landmarks selected. These two angles are set off on the three-arm protractor and the actual position of the buoy plotted on the chart by shifting the protractor about until the edge of each of the three arms passes through the center of the symbols on the chart marking the position of the three landmarks selected. The center of the hub of the protractor will indicate on the chart the actual position of the buoy, and if the point thus obtained does not coincide with the true position of the corner of the boundary as given on the chart, the surveyor can proceed to locate the buoy correctly by reversing the operation. This is done by placing the center point of the hub of the protractor over the corner of the boundary in question and measuring on the chart the two adjacent protractor angles between the three selected landmarks. One of the angles thus

obtained is set on the sextant and the boat moved about until the two landmarks are shown by the sextant to subtend the same angle obtained from the protractor. The second angle is then placed on the sextant and the same operation gone through, and so on, first using one angle on the sextant then the other until a point is reached where both observed sextant angles are practically identical with the protractor angles. The point thus located is the desired one and the buoy can be placed to mark the true position of the corner of the boundary in question.

If the engineer possesses two sextants and a protractor, this problem is far easier of solution, as the two angles can be set off on separate sextants and the observer can quickly find the desired point where they agree with the protractor angles by using one sextant after the other without the need of resetting either.

If there are two observers, two sextants, and a protractor, it can be seen that the best conditions for both rapid and accurate hydrographic location of a point is attained. In fact, this is the method by which the buoys at the corners of the boundaries were originally placed by the hydrographic engineer to the commission.

(3) *Magnetic bearings from offshore.*—This method of fixing a position on water is a simple and well-known one in navigation. It is available to anyone having a boat compass and will be of special use to the State fishery force in investigating cases where buoys are supposed to have been moved for illegal purposes.

In the case where a buoy is supposed to have been moved from its true position the observer can take compass bearings to the three landmarks given in the last column of the tables opposite the boundary corner in question. These bearings are then corrected for the local declination,<sup>1</sup> and if the results agree with the published bearings the buoy is correctly located.

In the case where the buoy is not in its correct position, or has disappeared altogether, the desired point can be determined by maneuvering the vessel until the corrected bearings agree with the ones in the tabular descriptions, when the buoy can be anchored in its proper location.

In the case where the landmarks, for which the bearings are published, have been destroyed or washed away, any landmarks whose positions are indicated on the charts can be used. This can be done by getting their bearings directly from the chart by parallel rulers or a protractor and then applying these new bearings in the same manner as the ones published in the tables.

(4) *Magnetic bearings from shore.*—This method will be of special value to engineers having an ordinary surveyor's compass. The compass can be set over the point marking a "triangulation station" on shore, the name of which is given in the last column opposite the "corner" in question. The instrument is then set at the corresponding "back" bearing (corrected for local magnetic declination) given in the fifth column of the tables opposite the "corner" in question. The direction thus determined will give one range on which the desired point must be located. The compass can then be moved to a second triangulation station and another range located in a similar manner. The intersection of these two range lines will give the desired point; but in general it should be checked by an additional range line determined from a third station.

<sup>1</sup>The mean magnetic variation for Queen Annes County is 6° 15' west of north in 1911 and increasing at the rate of 5' yearly.

(5) *Horizontal angles measured at landmarks.*—This process is a modification of the triangulation method, and will be useful to engineers who have a transit and desire considerable accuracy.

The instrument is placed over a "triangulation station," the name of which appears in the last column of the tabular description opposite the "corner" in question. The telescope is then pointed to the landmark indicated in the "Descriptions of landmarks" as having a direction of  $0^{\circ} 00' 00''$  from the triangulation station being occupied by the transit. The tabular description of the boundaries is next examined and the "back" bearing of the questionable boundary "corner" from the landmark being occupied is taken out. The angle calculated from this "back" bearing and the bearing given in parentheses alongside the zero landmark in the "Descriptions of landmarks" is then set off on the transit and a range line established on which the desired point must be located. A similar process is then carried on at a second station, and so on until the position of the buoy is satisfactorily fixed.

## APPENDIXES.

---

### APPENDIX A.—LAWS RELATING TO THE COOPERATION OF THE COAST AND GEODETIC SURVEY AND BUREAU OF FISHERIES WITH THE MARYLAND SHELL FISH COMMISSION.

The work of the Coast and Geodetic Survey and of the Bureau of Fisheries, in cooperation with the Maryland Shell Fish Commission, in surveying the oyster bars, establishing permanent landmarks at triangulation stations, and preparing for publication the necessary charts and technical and legal descriptions of boundaries and landmarks shown on these charts, has been executed in compliance with a request from the governor of the State of Maryland to the Secretary of Commerce and Labor, and by the authority of the following laws of the United States and Maryland:

[Act of Congress approved May 26, 1906.]

**AN ACT** To authorize the Secretary of Commerce and Labor to cooperate, through the Bureau of the Coast and Geodetic Survey and the Bureau of Fisheries, with the shellfish commissioners of the State of Maryland in making surveys of the natural oyster beds, bars, and rocks in the waters within the State of Maryland.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the Secretary of Commerce and Labor be, and he is hereby, authorized and directed, upon the request of the governor of the State of Maryland, to designate such officers, experts, and employees of the Bureau of the Coast and Geodetic Survey and of the Bureau of Fisheries as may be necessary to cooperate with the Maryland State board of shellfish commissioners in making a survey of and locating the natural oyster beds, bars, and rocks in the waters within the State of Maryland; and the Secretary of Commerce and Labor is hereby authorized and directed to furnish to the officers, experts, and employees of said Bureaus so detailed as aforesaid such instruments, appliances, and steam launches as may be necessary to make the survey aforesaid; and the Secretary of Commerce and Labor is hereby authorized to have made in the Bureau of the Coast and Geodetic Survey all the plats necessary to show the results of the aforesaid survey and the locations of the said natural oyster beds, bars, and rocks in the waters within the State of Maryland, and to furnish to the board of shellfish commissioners of the State of Maryland such copies as may be necessary, and for this purpose to employ, in the District of Columbia and elsewhere, such technically qualified persons as may be necessary to carry out the purpose of this act.

SEC. 2. That the Secretary of Commerce and Labor is hereby further authorized to have erected or constructed by the officers so detailed as aforesaid, while making such survey, such structures as may be necessary to mark the points of triangulation, so that the same may be used for such future work of the Coast and Geodetic Survey as the said Bureau may be hereafter required to perform in prosecuting the Government coast survey of the navigable waters of the United States located within the State of Maryland.

\*            \*            \*            \*            \*            \*            \*

SEC. 4. That this act shall take effect from the date of its passage.

[Act of Congress approved June 30, 1906.]

**AN ACT** Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and seven, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and seven, namely: \* \* \*

*Survey of Oyster Bars, Queen Annes County, Md.*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including the expenditures authorized under Public Act Numbered One hundred and eighty-one, approved May twenty-sixth, nineteen hundred and six, and contingent expenses incident thereto, five thousand dollars, together with the unexpended balance under this appropriation for nineteen hundred and six and prior years which is hereby reappropriated and made available on this account for the fiscal year nineteen hundred and seven. \* \* \*

---

[Act of Congress approved March 4, 1907.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and eight, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and eight, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, to be immediately available and to continue available until expended, twenty-five thousand dollars. \* \* \*

---

[Act of Congress approved May 27, 1908.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and nine, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and nine, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, which expenses, including cost of plats and charts, shall not exceed fifteen thousand dollars in any one year, to be immediately available, twenty thousand dollars.

---

[Act of Congress approved March 4, 1909.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and ten, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and ten, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, which expenses, including cost of plats and charts, shall not exceed fifteen thousand dollars in any one year, to be immediately available, twenty thousand dollars.

[Act of Congress approved June 25, 1910.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and eleven, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and eleven, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, to be immediately available, fifteen thousand dollars.

*Survey of Oyster Bars, Queen Annes County, Md.*

171

[Act of Congress approved March 4, 1911.]

AN ACT Making appropriation for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and twelve, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects herein-after expressed, for the fiscal year ending June thirtieth, nineteen hundred and twelve, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, to be immediately available, thirteen thousand dollars.

[Act of the Legislature of Maryland approved April 2, 1906.]

AN ACT To establish and promote the industry of oyster culture in Maryland, to define and mark natural oyster beds, bars and rocks lying under the waters of this State, to prescribe penalties for the infringement of the provisions of this Act, and \* \* \*

SECTION 1. *Be it enacted by the General Assembly of Maryland,* That the following sections be, and they are hereby, added to article 72 of the Code of Public General Laws, title "Oysters." \* \* \*

SEC. 86. The Board of Shell Fish Commissioners shall, as soon as practicable after the passage of this Act, cause to be made a true and accurate survey of the natural oyster beds, bars and rocks of this State, said survey to be made with reference to fixed and permanent objects on the shore, giving courses and distances, to be fully described and set out in a written report of said survey, as hereinafter required. A true and accurate delineation of the same shall be made on copies of published maps and charts of the United States coast and geodetic survey, which said copies shall be filed in the office of the said commissioners in the city of Annapolis, and the said commissioners shall further cause to be delineated upon copies of the published maps and charts of the United States coast and geodetic survey, of the largest scale, one copy for each of the counties of this State in the waters of which there are natural oyster beds, bars and rocks, all natural beds, bars and rocks lying within the waters of such county, which maps shall be filed in the offices of the clerks of the Circuit Court for the respective counties wherein the grounds so designated may lie. \* \* \*

SEC. 87. The Governor of this State is hereby requested to ask the assistance of the United States coast and geodetic survey, and of the United States Fish Commissioner, to aid in the carrying out of the provisions of the preceding section.

\* \* \* \* \*

SEC. 89. As soon as practicable after the first day of April, 1906, the said commissioners shall organize, and shall at once proceed, with the assistance of such person or persons as may be detailed by the United States coast and geodetic survey and the United States Fish Commissioner, to aid them in their work, and of such persons as may be appointed under the preceding section, to have laid out, surveyed and designated on the said charts, the natural beds and bars, and shall cause to be marked and defined as accurately as practicable the limits and boundaries of the natural beds, bars, and rocks as established by said survey, and they shall take true and accurate notes of said survey in writing, and make an accurate report of said survey, setting forth such a description of landmarks as may be necessary to enable the said board, or their successors, to find and ascertain the boundary lines of the said natural oyster beds, bars and rocks, as shown by a delineation on the maps and charts provided in this Act; said report shall be completed and filed in the office of the board in the city of Annapolis within ninety days after the completion of the survey of any county. Said commissioners shall cause the same to be published in pamphlet form, and transmit copies of the same to the Clerks of the Circuit court for the respective counties, where the charts have been filed or directed to be filed as hereinafter provided; the said report to be filed by the clerks of the several counties in a book kept for that purpose. And the said survey and report, when filed, subject to the right of appeal hereafter provided for in this Act, shall be taken in all of the courts of this State as conclusive evidence of the boundaries and limits of all natural oyster beds, bars and rocks, lying within the waters of the county wherein such survey and report are filed, and shall be construed to mean in all of the said courts that there are no natural oyster beds, bars or rocks lying within the waters of the counties wherein such report and survey are filed other than those embraced in the survey authorized by this Act, and that all areas of the Ches-

peake Bay and its tributaries within the State of Maryland, not shown in the survey to be natural oyster beds, bars or rocks shall be construed in all the courts of the State to be barren bottoms and open for disposal by the State for the purpose of private planting or propagation of oysters thereon under the provisions of this Act; provided, that the said survey and report shall not be construed as to affect in any manner the holdings by citizens of this State in any lot which may have been appropriated or taken up under the laws of this State prior to the approval of this Act.

The law of the State of Maryland, passed March 9, 1842, authorizing officers of the United States Coast and Geodetic Survey to enter upon the lands within the State limits for the purposes of the survey, is as follows:

AN ACT Concerning the Survey of the Coast of Maryland.

SECTION 1. *Be it enacted by the General Assembly of Maryland,* That it shall and may be lawful for any person or persons employed under and by virtue of an act of the Congress of the United States, \* \* \* at any time hereafter to enter upon lands within this State for the purpose of exploring, surveying, triangulating, or leveling, or doing any other matter or thing which may be necessary to effect the objects of said act, and to erect any works, stations, buildings, or appendages requisite for that purpose, doing no unnecessary injury to private or other property.

SEC. 2.<sup>1</sup> *And be it enacted,* That in case the person or persons employed under the act of Congress aforesaid, can not agree with the owners or possessors of the land so entered upon and used as to the amount of damage done thereto by reason of the removal of fences, cutting of trees or injury to the crop or crops growing on the same, it shall and may be lawful for the said parties or either of them to apply to the chief justice for the time being or one of the associate judges of the judicial district in which such land may be situated, who shall thereupon appoint three disinterested and judicious freeholders, residents of the same judicial district, to proceed with as much despatch as possible to the examination of the matter in question, and the faithful assessment of the damages sustained by the owners or possessors aforesaid, and the said freeholders or a majority of them, having first taken and subscribed an oath or affirmation before the chief or associate justice aforesaid or other person duly authorized to administer the same, that they will well and truly examine and assess as aforesaid, and having given five days' notice to both parties of the time of their meeting, shall proceed to the spot, and then and there upon their own view and if required, upon the evidence of witnesses (to be by them sworn or affirmed and examined), shall assess the said damages, and shall afterward make report thereof and of their proceedings in writing under their hands and seals and file the same within five days thereafter in the office of the clerk of the county in which the land aforesaid is situated, subject to an appeal by either party to the county court of the said county within ten days after filing as aforesaid, and the said report so made as aforesaid if no appeal as aforesaid be taken, shall be held to be final and conclusive as between the said parties, and the amount so assessed and reported shall be paid to the said owners or possessors of the land so damaged within twenty days after the filing of said report, and the said chief or associate justice as aforesaid, shall have authority to tax and allow upon the filing of said report, such costs, fees and expenses to the said freeholders for the performance of their duty as he shall think equitable and just, which allowance shall be paid by the person or persons employed under the act of congress aforesaid, within the time last above limited, but if an appeal as aforesaid be taken, the case shall be set down for hearing at the first term of county court aforesaid, ensuing upon and after appeal, and it shall be lawful for either party immediately after the entry of such appeal, to take out summons for such witnesses as may be necessary to be examined upon the hearing aforesaid, and the said court shall have power in its discretion to award costs against which ever the final judgment shall be entered, and such appeal at the option of either party may and shall be heard before and the damage assessed by a jury of twelve men to be taken from the regular panel and elected as in other cases.

SEC. 3. *And be it enacted,* That if any person or persons shall wilfully injure or deface or remove any signal, monument or building or any appendage thereto, erected, used or constructed under and by virtue of the act of congress aforesaid, such person or persons so offending shall severally forfeit and pay the sum of fifty dollars with costs of suit to be sued for and recovered by any person who shall first

<sup>1</sup> Under the rulings of the Comptroller of the Treasury no damages can be collected except through the United States Court of Claims unless an agreement has been made in advance.

prosecute the same before any justice of the peace of the county where the person so offending may reside, and shall also be liable to pay the amount of damages thereby sustained, to be recovered with costs of suit in an action on the case, in the name and for the use of the United States of America, in any court of competent jurisdiction.

---

APPENDIX B.—THE HAMAN OYSTER CULTURE LAW.

[Extract from Second Report of Shell Fish Commission.]

OBJECT.

"The legislature in placing chapter 711 of the acts of 1906, better known as the Haman Oyster Culture Law, upon the statute books of Maryland, had a twofold object in view.

1. To encourage an industry in oyster culture upon the barren bottoms beneath the tidewaters of the State.

2. To prevent the leasing of natural oyster bars for the purpose of oyster culture."

SURVEY.

"To make the leasing of barren bottoms possible and the leasing of natural bars impossible, provision was made for a survey of the natural bars for the purpose of accurately locating and marking the same. It was definitely provided that no barren bottoms should be leased in any part of the State until the natural bars of that region had been surveyed, charted, and marked with buoys."

DEFINITION OF A NATURAL OYSTER BAR.

NATURAL BAR NOT DEFINED.

"The Shell Fish Commission is instructed by section 90 of the Haman Oyster Culture Law to exercise its judgment liberally in favor of the natural bars when surveying, charting and buoying them, but other than this the Commission is uninstructed in this important matter. The responsibility of defining a natural bar is placed upon the Commission."

DIVERSITY OF OPINION.

"No definition of a natural oyster bar could be formulated by any man or body of men which would meet with the approval of all parties concerned. Oystermen, as a rule, hold that all bottoms where oysters grow or have grown naturally even though now practically barren of oysters should be considered natural bars. Other citizens of the State who are not directly interested in the oyster business, but interested in the oyster industry from the standpoint of revenue, hold, as a rule, that no bottoms should be excluded from leasing for oyster culture which, by methods known to oyster culturists, may be made to yield a greater number of oysters than they now produce."

"It should be evident to every one that neither of these definitions could be adopted by the Commission as a working basis for determining which of the grounds surveyed are natural oyster bars."

THE GOLDSBOROUGH DEFINITION.

The definition of a natural oyster bar which very nearly approaches a reasonable and satisfactory compromise between the views of the subject held by *oystermen* on one hand and by *oyster culturists* on the other is that contained in an opinion rendered by Judge Charles F. Goldsborough in the circuit court for Dorchester County in the July term, 1881, in the case of William T. Windsor and George R. Todd v. Job T. Moore.

This definition has been adopted by the Shell Fish Commission as the basis for the determination of the status of the various oyster bottoms surveyed, and is as follows:

What then is a natural bar or bed of oysters? It would be a palpable absurdity for the State to attempt to promote the propagation and growth of oysters and to encourage its citizens, by a grant of land, to engage in their culture, if the lands authorized to be taken up were only those upon which oysters do not and can not be made to grow. That there may be lands covered by water in the State where no oysters can be found, but where, if planted, they could be cultivated successfully, may be

possible, but, if so, I imagine that their extent must be too limited for them to be of much practical, general advantage for the purposes of such a law as the one under discussion; but there are thousands of acres of hard and shifting sands where oysters not only are not found, but where it would be folly to plant them, and these latter it can not be supposed that the State intended to offer to give away, for the simple reason that the State could not help knowing that nobody would have them.

Upon the other hand there are large and numerous tracts where oysters of natural growth may be found in moderate numbers, but not in quantities sufficient to make it profitable to catch them, and yet where oysters may be successfully planted and propagated. In my opinion these can not be called natural bars or beds of oysters, within the meaning of the act of assembly, and it is just such lands as these that the State meant to allow to be taken up under the provisions of the above-mentioned section of the act.

But there is still another class of lands where oysters grow naturally and in large quantities and to which the public are now and have been for many years in the habit of resorting with a view to earning a livelihood by catching this natural growth, and here, I think, is the true test of the whole question. Land can not be said to be a natural oyster bar or bed merely because oysters are scattered here and there upon it, and because if planted they will readily live and thrive there; but whenever the natural growth is so thick and abundant that the public resort to it for a livelihood, it is a natural oyster bar or bed and comes within the above-quoted restriction in the law, and can not be located or appropriated by any individual.

#### APPLICATION OF DEFINITION.

Before this definition may be of use in determining, accurately and scientifically, the status of an oyster ground, its central idea, "livelihood," must be expanded into accurately determinable factors, and these factors must be confined into a practical scheme of investigating the condition of the ground under consideration.

Stated briefly, a *livelihood* is represented by a *sum of money* obtained from the sale, at a fixed *price*, of a certain *quantity of oysters* gathered in a given *time* from an allotted *area* of ground.

Knowing the value of each of these factors it becomes possible to calculate the number of oysters an oyster ground must produce per square yard in order that oystermen may secure a livelihood by working upon it.

NOTE.—The factors into which the commission resolved the livelihood problem, the value assigned to each factor, and the scheme devised for practical use in examining and applying the definition to oyster bottoms are given in outline in their second report under the heading of the preceding extract, and in detail in their first report on pages 32 to 69.

#### APPENDIX C.—SUMMARY OF THE PARTICULAR SURVEYING OPERATIONS WHICH CONSTITUTE AN "OYSTER SURVEY" AS NOW BEING CARRIED ON IN MARYLAND.

*Explanation.*—A brief account of the particular surveying operations which constitute an "oyster survey" as now being carried on in Maryland will assist in the interpretation of records contained in the technical part of this report, and will be of interest to many who may not understand the necessity for the great amount of work being done or its complicated character.

To those familiar with methods used in surveying and charting the characteristic features of large bodies of water there is an evident necessity for the various operations performed, especially when it is known that the boundaries of the public oyster bars and of the private lots leased for purposes of oyster culture must be surveyed and charted with the greatest practical accuracy. To others it will be sufficient to state that the actual experience gained from oyster surveys in other States has proven that in order to avoid endless dissatisfaction and litigation it is necessary to accurately locate and permanently establish oyster boundaries as is now being done in Maryland.

*Triangulation survey.*—Such refinement of survey work as that demanded by the conditions of an oyster survey when carried on at considerable distances offshore can only be obtained by the use of a system of triangulation as a framework or foundation. Therefore, a triangulation survey including the permanent marking of the positions of landmarks with monuments and a record of the descriptions of their locations for future recovery is a necessary operation of a complete oyster survey.

*Topographic survey.*—The technical records which establish the relation between the offshore oyster boundaries and triangulation landmarks are sufficient for the requirements of engineers in making resurveys, but do not supply the needs of others who are interested in the same boundaries by reason of their occupation as oystermen concerned as to the public oyster bars, or oyster culturists concerned

as to the leasable bottoms. For these it is necessary to have the charts of the survey show the relation of the shore line and other topographic features to the boundaries of the public oyster bars and private oyster farms. Therefore, a topographic survey is a necessary operation of a complete oyster survey.

*Hydrographic survey.*—In the settlement of the important question of what is, or what is not, a natural oyster bar, and in the consideration of bottoms to be selected for purposes of oyster culture, information as to the depth of water and the character of the bottom is required. Therefore, a hydrographic survey is a necessary operation of a complete oyster survey.

*Necessary foundation for an oyster survey.*—Consequently, the necessary components of a satisfactory foundation for a complete oyster survey are the three classes of survey operations technically named triangulation, topography, and hydrography, or, stated in another way, the foundation of a practical oyster survey includes the surveying operations usually followed by the Coast and Geodetic Survey leading up to the preparation and publication of nautical charts.

*Special surveys and investigations pertaining to oysters.*—Having obtained this cartographic survey for a foundation, partly by new work and partly from records of previous work of the Government, the combined operations<sup>1</sup> making up an "oyster survey" are completed by superimposing on this foundation special surveys and investigations pertaining particularly to oysters or other shell fish.

The special surveys pertaining to oysters furnish information as to the location and outline of oyster-shell bottoms, and are carried on by the sounding boat party in addition to the usual hydrographic work.<sup>2</sup> This operation consists of the observation and record of the character of vibration of a wire and chain apparatus which is dragged over the bottom, the vibrations or lack of vibrations indicating the presence and quantity of shells or absence of shells.

The special oyster investigations<sup>3</sup> consist of the actual determination of the kind and quantity of oysters on the bottom, and such economic and biological studies of the supply of oyster food, density of water, character of the bottom, and other important matters as affects the growth of oysters. In this work the oyster investigation stations are located and buoyed by the hydrographic party while engaged in the survey of the oyster-shell limits. They are selected with the view of obtaining characteristic data which can be used for the interpretation of the recorded vibrations of the chain apparatus at all other points covered by the survey.

*Preparation of results.*—The actual surveying operations and oyster investigations having been completed for any one county, there still remains technical work of nearly equal magnitude to that described.<sup>4</sup> This work consists of the preparation of charts and technical descriptions of boundaries and landmarks for publication by the Government, the preparation of that part of the annual report of the commission covering the special oyster surveys and investigations, the making of the leasing charts and finished projections, and finally the filing of the oyster charts and records with the courts and the commission, thus opening a county for oyster culture.

*Summary.*—From the foregoing account it can be seen that a complete oyster survey properly conducted so as to answer all practical requirements of the present and permanency of results for the future is a very complicated affair, involving many lines of surveying and other scientific work, and requiring the professional services of experts in the various operations of cartographic surveying and shell-fish investigations.

<sup>1</sup> See Appendix D of this publication for "Statistics of results of combined operations of the Government and State."

<sup>2</sup> See pp. 104 to 123 of First Annual Report of Maryland Shell Fish Commission.

<sup>3</sup> See pp. 30 to 67 and 129 to 199 of First Annual Report of Maryland Shell Fish Commission.

<sup>4</sup> No mention is made here of the large amount of administrative work of the commission, which is greatly complicated and increased by the effect of the oyster-survey operations on many thousands of people whose interests are more or less involved; or of the large amount of survey work involved in the survey and record of the boundaries of oyster lots leased from the State by private individuals for the purposes of oyster culture.

## Survey of Oyster Bars, Queen Annes County, Md.

APPENDIX D.—STATISTICS OF RESULTS OF THE COMBINED OYSTER SURVEY OPERATIONS OF THE GOVERNMENT AND STATE.<sup>1</sup>

Operations	Anne Arundel County	Somerset County	Wicomico County	Worcester County	Calvert County	Charles County
Beginning of field work.....	June 29, 1906	May 2, 1907	Aug. 27, 1907	Nov. 8, 1907	May 2, 1908	Aug. 18, 1908
Filing of certified charts and reports.....	June 20, 1907	July 1, 1908	Dec. 1, 1908	Apr. 12, 1909	Dec. 14, 1909	Jan. 27, 1911
Natural oyster bars surveyed and delineated.....	91	37	15	28	41	15
Acres of natural oyster bars.....	33,666	27,566	2,038	1,655	12,303	2,285
Crab bottoms surveyed and delineated.....		54				
Acres of crab bottoms.....		32,108				
Clam beds surveyed and delineated.....		3				
Acres of clam beds.....		506				
Boundary buoys located and planted.....	362	154	53	108	149	51
Triangulation landmarks established.....	123	86	30	48	78	42
Miles of shore line covered by triangulation.....	110	125	46	95	95	32
Square miles of water covered by triangulation.....	220	375	44	110	157	20
Miles of examination of shell bottom with chain apparatus.....	369	296	58	63	250	38
Oyster-investigation stations occupied.....	440	679	162	147	667	113
Tide stations established.....	4	3	1	1	2	1
Number of soundings over shell bottoms.....	37,949	17,904	3,387	3,649	11,292	1,631
Square miles covered by soundings and chain apparatus.....	58	47	3	3	30	4
Projections prepared and plotted.....	9	13	2	5	8	3
Leasing charts prepared.....	13	12	2	3	5	2
Oyster charts published.....	4	6	2	3	5	1
Reports published.....	2	2	2	2	2	2
Progress maps published.....	2	2	2	2	2	2

Operations	St. Marys County	Baltimore County	Kent County	Queen Annes County	Total <sup>2</sup>
Beginning of field work.....	May 2, 1908	Apr. 14, 1909	Apr. 14, 1909	Apr. 14, 1909	
Filing of certified charts and reports.....	July 6, 1911	Aug. 10, 1911	Oct. 5, 1911	Nov. 29, 1911	
Natural oyster bars surveyed and delineated.....	124	3	64	98	316
Acres of natural oyster bars.....	25,778	3,010	12,800	24,721	<sup>3</sup> 145,831
Crab bottoms surveyed and delineated.....					54
Acres of crab bottoms.....					32,108
Clam beds surveyed and delineated.....					3
Acres of clam beds.....					506
Boundary buoys located and planted.....	513	13	211	340	1,954
Triangulation landmarks established.....	238	15	147	199	765
Miles of shore line covered by triangulation.....	160	12	110	240	840
Square miles of water covered by triangulation.....	180	10	130	500	1,472
Miles of examination of shell bottom with chain apparatus.....	400	33	164	288	1,959
Oyster-investigation stations occupied.....	1,472	64	1,151	1,949	6,344
Tide stations established.....	7	1	3	3	25
Number of soundings over shell bottoms.....	19,334	1,080	8,123	13,880	117,339
Square miles covered by soundings and chain apparatus.....	57	6	21	47	276
Projections prepared and plotted.....	15	4	10	12	58
Leasing charts prepared.....	10	1	4	11	62
Oyster charts published.....	8	1	3	4	32
Reports published.....	2	2	2	2	13
Progress maps published.....	2	1	1	1	12

<sup>1</sup> These statistics do not include the large amount of triangulation, topography, and hydrography resulting from previous work of the Coast and Geodetic Survey, which was utilized in the preparation of the published oyster charts and records. Work in Talbot and Dorchester counties has been finished, but final statistics of results will not be published until these counties are opened for oyster culture.

<sup>2</sup> Less quantities covered by statistics of more than 1 county.

<sup>3</sup> Total area of natural oyster bars of Connecticut is 5,770 acres.

# SURVEY OF OYSTER BARS

## ST. MARYS COUNTY MARYLAND

DESCRIPTION OF BOUNDARIES AND LANDMARKS AND  
REPORT OF WORK OF UNITED STATES COAST  
AND GEODETIC SURVEY IN COOPERATION  
WITH UNITED STATES BUREAU OF  
FISHERIES AND MARYLAND  
SHELL FISH COMMISSION

By C. C. YATES

CHIEF OF COAST AND GEODETIC SURVEY PARTY  
ASSISTANT, COAST AND GEODETIC SURVEY

WASHINGTON  
GOVERNMENT PRINTING OFFICE  
1911

## LETTER OF SUBMITTAL.

---

DEPARTMENT OF COMMERCE AND LABOR,  
COAST AND GEODETIC SURVEY,  
*Washington, July 6, 1911.*

SIR: I have the honor to transmit herewith a report of the officer detailed from the Coast and Geodetic Survey to cooperate with the Bureau of Fisheries and the Maryland Shell Fish Commission in surveying the oyster bars of the State of Maryland, together with certain technical results which are necessary for the interpretation and use of the plats of the survey made by the Government.

This work has been done under the provisions of the act of Congress entitled "An act to authorize the Secretary of Commerce and Labor to cooperate, through the Bureau of the Coast and Geodetic Survey and the Bureau of Fisheries, with the shell fish commissioners of the State of Maryland in making surveys of the natural oyster beds, bars, and rocks in the waters within the State of Maryland," approved May 26, 1906, and of the acts of Congress making appropriations for sundry civil expenses of the Government for the fiscal years ending June 30, 1907, 1908, 1909, 1910, and 1911.

Respectfully,

O. H. TITTMANN, *Superintendent.*

To HON. CHARLES NAGEL,  
*Secretary of Commerce and Labor.*

## CERTIFICATION.

---

BALTIMORE, MD., *July 5, 1911.*

The following publication is certified to contain correct technical descriptions of all boundaries and landmarks established in St. Marys County by the Maryland Shell Fish Commission in cooperation with the United States Coast and Geodetic Survey.

C. C. YATES,  
*Chief of Coast and Geodetic Survey Party,*  
*Assistant, Coast and Geodetic Survey.*

---

Examined and certified to be correct.

BALTIMORE, MD., *July 5, 1911.*

WALTER J. MITCHELL,  
CASWELL GRAVE,  
BENJAMIN K. GREEN,  
*Maryland Shell Fish Commission.*  
SWEPSON EARLE,  
*Hydrographic Engineer.*

NOTE.—Certified copies of this publication and of the charts of the natural oyster bars of St. Marys County were filed in the office of the clerk of the circuit court of St. Marys County and in the office of the board of shell fish commissioners on July 6, 1911.

# SURVEY OF OYSTER BARS, ST. MARYS COUNTY, MD.

## INTRODUCTION.

### PUBLICATIONS.

The preparation of publications relating to the survey of the oyster bars of Maryland has been divided between the Government and the State in accordance with the laws<sup>1</sup> authorizing the work and the natural division of the surveying operations<sup>2</sup> of the cooperating forces.

The publications prepared and issued by the Government, under the direction of the Superintendent of the Coast and Geodetic Survey, consist of a series of charts and a technical report for each county surveyed.<sup>3</sup> The charts show all legal boundaries of oyster bars within the adopted boundaries of the waters opened up for leasing with each county, and the location of all landmarks (Coast and Geodetic Survey triangulation stations) used as a foundation for the delineation of these various boundaries. The technical report gives technical and legal descriptions of all oyster bar and other boundaries, and descriptions of all landmarks shown on the charts, and includes the report of the representative of the Coast and Geodetic Survey in charge of the work of that service in cooperation with the Bureau of Fisheries and the Maryland Shell Fish Commission. These charts and technical reports are prepared and certified for file with the courts and the Commission, as required by the laws of the State, and contain all information necessary to make a permanent record of the work of the Commission and the Government for all future requirements of the courts, or for any resurveys that may become necessary.<sup>4</sup>

The publications prepared and issued by the State under the direction of the Shell Fish Commission consist of annual reports<sup>5</sup> of all the operations of the Commission performed under the provisions of the laws of Maryland,<sup>6</sup> including results of biological

<sup>1</sup> See Appendix A for laws relating to the cooperation of the Coast and Geodetic Survey and Bureau of Fisheries with the Maryland Shell Fish Commission.

<sup>2</sup> See Appendix C for a summary of the particular surveying operations which constitute an "oyster survey" as now being carried on in Maryland.

<sup>3</sup> These charts and technical reports can be obtained by application to the Superintendent of the Coast and Geodetic Survey at Washington, D. C. The publications now ready for issue are those for Anne Arundel, Somerset, Wicomico, Worcester, Calvert, Charles, and St. Marys counties.

<sup>4</sup> The technical records and charts for each county are published separately on account of the requirements of the oyster-culture laws of the State and the practical considerations which make it desirable to have each county "opened up" for oyster culture as soon as practicable after the completion of its survey. For these reasons and the fact that these reports are each arranged for distribution and use in one county only without reference to other published records, much of the text of this publication is of necessity identical with similar previous publications for other counties.

<sup>5</sup> These reports can be obtained by application to the shell fish commission, Marine Bank Building, Baltimore, Md. They are issued annually in October, and the first and second reports are now available for distribution.

<sup>6</sup> See Appendix B for an extract from the Second Report of the Maryland Shell Fish Commission, giving a concise summary of the "Haman Oyster Culture Law."

and economic oyster investigations, methods and results of the hydrographic survey of the boundaries of oyster bars and crab bottoms, the administrative report and financial statement of the Commission, information relating to oyster culture, methods of surveying and leasing of oyster lots, and much other important matter of legal and scientific value.

These two sets of publications are planned and arranged to supplement each other without unnecessary duplication, and when combined they form a complete report of operations, methods, and results of the work of both the Government and State.<sup>1</sup>

#### COOPERATION OF THE COAST AND GEODETIC SURVEY.

The work of the Coast and Geodetic Survey, as the name of the service indicates, includes a survey of the coasts of the United States made on a geodetic basis. This has involved the gradual construction of a great framework of interstate triangulation for use as a foundation for detail hydrographic and topographic surveys, from which there has been compiled and published a complete set of charts of the coasts of the United States, including all waters of Maryland where oysters grow. This existing triangulation, hydrography, and topography is essential as a foundation for a correct and practical survey of natural oyster bars; and it being one of the fundamental functions of the Coast and Geodetic Survey to furnish such data, the cooperation of the Coast and Geodetic Survey with the Bureau of Fisheries and the Maryland Shell Fish Commission is a practical and natural development of Government work leading to the conservation and increase of the supply of food.

#### COOPERATION OF THE BUREAU OF FISHERIES.

The Bureau of Fisheries has cooperated with the Coast and Geodetic Survey and the Maryland Shell Fish Commission principally as an adviser in matters relating to the biological and economic survey of oyster bars and the methods to be employed for that purpose.<sup>2</sup> A steam launch, rowing boat, and certain apparatus have also been furnished.

The primary function of the Bureau of Fisheries is to increase the productiveness of marine and fresh waters by such measures as may be best suited to the purpose, and the services rendered in connection with the survey of the oyster bars of Maryland are strictly in line with the fundamental law under which it acts. In certain States other than Maryland similar work has been conducted by the Bureau acting independently, the same ends being attained at greater expense to the Government.

#### GENERAL STATEMENT OF WORK OF COAST AND GEODETIC SURVEY.<sup>3</sup>

The results obtained from the work of the Coast and Geodetic Survey in cooperation with the Bureau of Fisheries and the Maryland Shell Fish Commission need very little other summary than is indicated by the published Charts of Natural Oyster Bars and the index of hydrographic projections and triangulation stations shown on the county progress maps attached to each report.

<sup>1</sup> See Appendix D of this publication for "Statistics of results of combined operations of the Government and State."

<sup>2</sup> Hon. George M. Bowers, Commissioner of Fisheries, has detailed for this service Dr. H. F. Moore, assistant, Bureau of Fisheries.

<sup>3</sup> For a detail statement of the very large amount of excellent oyster survey work of the Maryland Shell Fish Commission see the annual reports of the Maryland Shell Fish Commission.

The triangulation has been carried on in accordance with the standard methods of the Coast and Geodetic Survey, making this work and that of the Descriptions of Triangulation Stations of permanent value, not only to the State of Maryland in the survey of her oyster bars, but also to the Government for any future work it may do in the regions covered by the oyster-survey operations.

The hydrographic projections and published charts are prepared with all the accuracy permitted by their large scale, especially as to the boundaries of the various shell-fish bottoms in relation to landmarks, but this accuracy of location on the charts is further added to and permanently fixed by published technical descriptions which should minimize the probability of any future dispute as to either landmarks or boundaries.

Stated another way, and quoting from the report of the "Survey of Oyster Bars of Anne Arundel County."

The geographic positions of the permanent landmarks and signals have been determined with the usual precision of a trigonometric survey, and their locations at all points necessary to provide ample foundation for the surveying and charting operations permitted great accuracy of definition and location for the natural oyster bar and other boundaries established. At the same time, the very important element of permanency of the positions of boundaries has been secured, as the relocation of geodetic positions can always be accomplished by a competent surveyor, even though the original landmarks and monuments have been washed away, as has been the fate of hundreds of such points established by the Coast and Geodetic Survey on the shores of the Chesapeake Bay during the last 65 years.

REPORT OF THE WORK OF THE COAST AND GEODETIC SURVEY IN  
ST. MARYS COUNTY.

INSTRUCTIONS.

The following letters, together with the laws<sup>1</sup> of the United States relating to the subject, constitute the "instructions" received by the chief of the Coast and Geodetic Survey party engaged on work in connection with the Maryland Shell Fish Commission. They are short and definite, but furnish ample authority and leeway for all legitimate development of the cooperation of the Government and the State in the survey of oyster bars. The "free hand" permitted by these orders, together with the aid and many valuable suggestions received from the officers of the survey at Washington, have proved very beneficial to the work and are greatly appreciated.

DEPARTMENT OF COMMERCE AND LABOR,  
OFFICE OF THE SECRETARY,  
*Washington, June 2, 1906.*

SIR: In reply to your letter of May 28, requesting me to designate officers of the Coast and Geodetic Survey and of the Bureau of Fisheries to cooperate with the State of Maryland in making survey of and locating the natural oyster beds, I have the honor to inform you that Mr. C. C. Yates will be designated to cooperate on the part of the Coast and Geodetic Survey as soon as Congress makes the provisions of the act effective by providing an appropriation for the purpose.

Respectfully,

His Excellency HON. EDWIN WARFIELD,  
*Governor of Maryland, Annapolis, Md.*

LAWRENCE O. MURRAY, *Assistant Secretary.*

---

DEPARTMENT OF COMMERCE AND LABOR,  
COAST AND GEODETIC SURVEY,  
*Washington, July 3, 1906.*

SIR: Upon the receipt of these instructions you will surrender the command, accounts, etc., of the steamer *Endeavor* to the Hydrographic Inspector. \* \* \*

As soon as this transfer is completed you will enter upon the duties of Coast Survey representative on the Shell Fish Commission of Maryland.

You will consult the Commissioners, prepare a program of work, and submit estimates in the usual form.

You are authorized to come to Washington for consultation from time to time as may be necessary.

\* \* \* \* \*

Very respectfully,

Capt. C. C. YATES,  
*United States Coast and Geodetic Survey Steamer Endeavor, Baltimore, Md.*

O. H. TITTMANN, *Superintendent.*

ORGANIZATION AND EQUIPMENT.

The personnel and occupation of the party of the Coast and Geodetic Survey have remained practically unchanged since the beginning of the "oyster survey." Besides

<sup>1</sup> For these laws see Appendix A.

the chief of party, it consists of the necessary triangulators, computers, draftsmen, and temporary employees required to carry on both the surveying operations in the field and the preparation for publication of oyster charts and technical records in the office at Washington.

The equipment for the work of the party has been ample and satisfactory. The large living and office quarters furnished the Government on the Maryland Shell Fish Commission house-boat *Oyster* have been very convenient for the work, besides facilitating efficient cooperation with the surveying and oyster investigation parties of the State. In addition to the accommodations on the *Oyster*, the Coast and Geodetic Survey party has had the constant use of the large steam launch *Inspector* and several other boats furnished by its own service, and the occasional use of the Bureau of Fisheries launch *Canvasback*<sup>1</sup> and the steamer *Governor McLane*<sup>2</sup> of the State fishery force.

The greater part of the equipment of instruments for the operations of both the Government and State has been furnished by the Coast and Geodetic Survey and consists of all necessary theodolites, levels, sextants, drafting instruments, hydrometers, etc., required for all field and office work.

#### CHRONOLOGICAL STATEMENT OF WORK.

The field work of the Coast and Geodetic Survey in St. Marys County<sup>3</sup> dates from May 2, 1908, when the house-boat *Oyster* left Baltimore for an anchorage in the Patuxent River, inside of Solomons Island. She remained in this harbor for three months, it practically being the only suitable anchorage for the work of the oyster survey for a large part of the Chesapeake Bay shore of both St. Marys and Calvert counties, as well as for the lower Patuxent River. During this period there was a great amount of windy weather and consequent rough seas, which prevented work in the open bay, and in general the triangulation foundation for the oyster survey made very slow progress.

On August 4, 1908, the part of the work necessarily done from the mouth of the Patuxent River was completed, and the *Oyster* was moved about 7 miles up the river to St. Leonards Creek.

On August 18, 1908, the headquarters for the field work was again changed by moving the house-boat *Oyster* 8 miles still farther up the river to an anchorage in Battle Creek, where she remained until the completion of that part of the field work which naturally included all the Patuxent River work of Charles and Calvert counties as well as that of St. Marys County, although the results are published separately.

On September 3, 1908, the house-boat finally left the Patuxent River for Smiths Creek, which is one of the tributaries of Potomac River. From this station there was completed all the remaining work of the Chesapeake Bay shore of St. Marys County as well as that of Smiths Creek and the mouth of St. Marys River.

During the stay at Smiths Creek the work was greatly delayed by smoky atmosphere, especially that portion in the open Chesapeake Bay just north of the mouth of Potomac River, where some of the triangulation sides were necessarily comparatively long.

<sup>1</sup> By courtesy of Dr. H. F. Moore, U. S. Bureau of Fisheries.

<sup>2</sup> By courtesy of Capt. James A. Turner, commanding.

<sup>3</sup> The field work of St. Marys, Calvert, and Charles counties was so intermixed in the Patuxent River that the chronological statement of work for any one of these counties necessarily includes a considerable part of the work of the other two counties.

On October 7, 1908, the house-boat *Oyster* was towed to an anchorage at the upper end of St. Marys River off the site of the monument marking Calvert's first settlement in Maryland. From this point the remaining work in St. Marys River, St. Inigoes Creek, and St. Georges River was quickly finished on account of very good weather.

On October 28, 1908, the State steamer *Governor McLane* towed the *Oyster* to an anchorage off Rock Point, in the mouth of Wicomico River. From this location there was done all the oyster survey work of both St. Marys and Charles Counties in Wicomico River, St. Catherine Sound, and adjacent waters.

On November 25, 1908, the four launches of the combined oyster-survey parties towed the house-boat *Oyster* to harbor off the city of Leonardtown, at the head of Breton Bay. From this station all the oyster-survey work was completed in both Bretons Bay and St. Clements Bay.

On December 18 and 19, 1908, the *McLane* towed the house-boat *Oyster* and launches to their winter quarters in Baltimore.

On December 2, 1909, it was found necessary to obtain additional triangulation information for the publication of the technical report for Calvert County, which incidentally involved new work required for the report for Charles and St. Marys counties, and field work was carried on for that purpose from that date to December 8, 1909.

Again, from July 20 to August 11, 1910, while the house-boat *Oyster* was anchored in the mouth of the Patuxent River for the purpose of carrying on the oyster survey operations in the bay-shore waters of Dorchester County, a number of days when work could not be done in the open bay were employed in checking up deficiencies in the description of stations required for the publications of both Charles and St. Marys Counties.

The large amount of office work connected with the "oyster survey" of St. Marys County, including computations and drafting necessary for the preparation for publication of the oyster charts and the technical records, was continued intermittently with the office work of other counties from the beginning of the fieldwork in St. Marys County to the time of filing of the certified oyster charts and the technical reports in the archives of the Commission and with the clerk of the circuit court of St. Marys County on July 6, 1911.

#### STATISTICS.<sup>1</sup>

Landmarks and triangulation signals erected . . . . .	204
Monuments planted to mark triangulation stations . . . . .	204
Triangulation stations occupied for observations of horizontal angles . . . . .	186
Old triangulation stations recovered . . . . .	33
New triangulation stations established . . . . .	205
Total old and new triangulation stations marked and described . . . . .	238
Linear miles of shore line covered by triangulation (approximate) . . . . .	160
Square miles covered by triangulation (approximate) . . . . .	180
Hydrographic projections prepared and completed as records of oyster boundaries . . . . .	15
Triangles computed . . . . .	443
Geographic positions computed . . . . .	210
Corners of oyster boundaries established by computation . . . . .	603

<sup>1</sup> These statistics only include field and office work directly performed by the party of the Coast and Geodetic Survey in connection with the oyster survey of St. Marys County, and do not include the many thousands of soundings and examinations of the character of the bottom made by the engineers of the Commission, which are of considerable value to the Coast and Geodetic Survey as hydrographic records for future use in connection with the preparation of new editions of charts of the waters of Maryland. See Appendix D of this publication for "Statistics of results of combined operations of the Government and the State."

## GENERAL REMARKS.

Before ending this report the representative of the Coast and Geodetic Survey wishes to renew his statement of appreciation of the courteous assistance received from various Government and State officials and others interested in the oyster industry of Maryland, especially to the following:

To his colleague from the Department of Commerce and Labor, Dr. H. F. Moore, of the Bureau of Fisheries, whose well-known scientific knowledge of all matters relating to oysters has been of great value to the work.

To Mr. Walter J. Mitchell, chairman of the Maryland Shell Fish Commission, who, by his administrative ability in carrying out the complicated requirements of the oyster laws and by his unflinching tact, has made the cooperation of the various services engaged on the work both agreeable and effective.

To Dr. Caswell Grave, secretary of the commission, who, as editor of the commission's annual report and commissioner in charge of the biological and economic oyster investigations, has been brought into constant contact with the Government work and aided its operations in every way.

To Mr. Benjamin K. Green, treasurer of the commission, who has looked after the equipment and commissary of the house-boat in such a way as to add greatly to the comfort and convenience of the party of the Coast and Geodetic Survey.

To Mr. Swepson Earle, hydrographic engineer to the Commission, whose knowledge of the work from former service in the Coast and Geodetic Survey has greatly facilitated his practical use of the technical data furnished by the Government.

To Mr. Thomas H. Robinson, counsel to the Commission, for courteously furnishing valuable information relating to county boundaries.

And to the many others connected with the Commission or who, as residents in the locality where the work was being carried on, have greatly assisted by furnishing important information or willing services.

## CHARTS AND MAPS.

### CHARTS OF NATURAL OYSTER BARS.

The charts<sup>1</sup> of the natural oyster bars of St. Marys County, published by the Coast and Geodetic Survey from results of surveys of the Government in cooperation with the Maryland Shell Fish Commission, consist of eight sheets covering all the waters of St. Marys County in Patuxent River, Chesapeake Bay, Smiths Creek, St. Marys River, and tributaries, Bretons Bay, St. Clement Bay, and Wicomico River.<sup>2</sup> They are published on a scale of 1 part in 20,000 (approximately  $3\frac{1}{8}$  inches to a statute mile) and are constructed on polyconic projections and based on the United States standard datum of the Coast and Geodetic Survey.

These charts show all oyster bars and other boundaries established by the Commission and are certified for the purpose of filing in the office of the clerk of the Circuit Court of Charles County and in the office of the Commission at Annapolis, as required by the oyster laws of Maryland.

In addition to the oyster bar and other boundaries, the charts show the location and name of all landmarks (United States Coast and Geodetic Survey triangulation stations) used in making the survey, together with the hydrography and topography<sup>3</sup> necessary to make the technical definitions and delineations of boundaries readily understandable both by the people engaged in the oyster industry and the general public who may become interested through leasing of barren bottoms for oyster culture.

The names of the oyster bars are those used locally, as nearly as could be ascertained by the hydrographic engineer of the Commission. When there was no local name in common use, a name was selected from one of the prominent features of the vicinity. By the use of recognized names or those that would naturally suggest certain sections of water, it is believed that much confusion will be avoided in the location on the charts of the oyster bars, especially by those not familiar with the use of maps.

The corners of the oyster bars are numbered from 1 to the total number of corners in each area under consideration. Where boundaries adjoin, making one point a corner of two or more oyster bars, these points have two or more numbers, each number corresponding to the bar in which the figure is located. The numbers of the corners correspond with the technical and legal descriptions of this publication under the heading "Boundaries of natural oyster bars."

The landmarks and oyster bars have been grouped in the "Contents" of this publication in accordance with the charts upon which they are shown. To find a particular

<sup>1</sup> These charts can be obtained by application to the Superintendent of the Coast and Geodetic Survey, at Washington, D. C.

<sup>2</sup> The open waters of the Potomac River, although within the accepted boundaries of the State of Maryland, are under the joint jurisdiction of both Maryland and Virginia as to fisheries, and therefore the natural oyster bars of the Potomac River were not surveyed or are they shown in any way on the oyster charts of the adjacent counties of St. Marys and Charles.

<sup>3</sup> Much of the detail of the inshore topography was obtained from the excellent map of St. Marys County, prepared and published by the Maryland Geological Survey under the direction of Dr. William Bullock Clark from surveys of the Maryland Geological Survey in cooperation with the U. S. Geological Survey.

oyster bar or landmark which is only known by name, consult the "Contents" and the desired chart and general location will be indicated. To find the name of a bar or landmark which is only known by location, consult the progress map at the end of this publication for the number of the chart on which it is to be found, and then examine the known locality on the chart for the name of the bar or landmark in question.

The contours on the charts showing the depth of water at mean low tide have been taken from the hydrographic sheets of former work of the Coast and Geodetic Survey. Four curves were selected as being the most convenient for taking off from the original hydrographic sheets and the ones of greatest value to those interested in shellfish industries. The 1-fathom contour (6 feet) and the 5-fathom curve (30 feet) correspond in a general way to the inner and outer limits of all the oyster bars surveyed. The 3-fathom contour (18 feet) furnishes the curve of about the average depth of water on the oyster bars and the 10-fathom contour (60 feet) serves in a general way to indicate the outer limits of probable oyster culture.

The boundaries of the waters within the "territorial limits of the county" and the boundaries of the "waters contiguous to the county" opened up for the leasing with St. Marys County are plainly indicated on the charts. A full technical description of these boundaries is given in this publication under the heading "Boundaries of county waters."

The areas in acres of the oyster bars were determined under the direction of the hydrographic engineer of the Commission by two independent planimeter measurements of the areas as delineated on the smooth projections of the Coast and Geodetic Survey. These areas are given in small figures in parentheses on the face of the chart within the boundaries of the different shellfish bottoms.

The symbols used on the charts for the different kinds of boundaries, triangulation stations, contours of depth of water, etc., require no other explanation than that given in the legend and other notes on the face of the charts.

#### LEASING CHARTS.

The leasing charts of St. Marys County, like those for Anne Arundel, Somerset, Wicomico, Worcester, Calvert, and Charles counties, have been prepared under the direction of the hydrographic engineer of the Commission. These charts are constructed on polyconic projections and are based on the United States standard datum of the Coast and Geodetic Survey. They are made on the scales of 1 part in 5,000 or 1 part in 10,000, as the needs of oyster culture may require. Anne Arundel County required 13 leasing charts; Somerset County, 12 charts; Wicomico County, 2 charts; Worcester County, 3 charts; Calvert County, 5 charts; Charles County, 2 charts; and St. Marys County, 8 charts to cover their oyster bottoms.

These charts show all the oyster bars, crab bottoms, and clam beds and other boundaries established by the Commission, and also all boundaries of oyster lots leased for the purpose of oyster culture, thus making them comprehensive and valuable records of the results of the operations of the oyster-culture laws.

The lots leased under the provision of the "old 5-acre law" are frequently of irregular shape, but the lots leased under the provision of the new oyster laws must be of rectangular shape by the terms of that act. For this latter purpose the leasing charts

have been divided by parallels of latitude and meridians of longitude into small rectangles of 1 acre or 5 acres, as may be best suited to the area under consideration, and prospective leaseholders by the rules of the Commission are compelled to select whole rectangles as far as possible.

For reasons of the present changeable nature of the number of lots leased and the large number of charts required, the leasing charts are not likely to be published for some years, but they can be seen at any time on file at the offices of the Commission, in the Marine Bank Building at Baltimore.

#### PROJECTIONS.

The polyconic projections<sup>1</sup> covering St. Marys County waters are 15 in number and on the scale of 1 part in 10,000. They were constructed by draftsmen of the Coast and Geodetic Survey, but the sextant positions which determine the location of the legal boundaries of the oyster bars as delineated by the Shell Fish Commission were plotted by the draftsman of the Commission.

A copy of each of these projections, with all the plotted positions of triangulation stations, shore line, sextant positions, and boundaries of oyster bars, was made under the direction of the hydrographic engineer of the Commission by pricking through with a sharp needle the intersections of the projection lines and all other points as plotted on the original sheets.

These projections (in duplicate) are the original records of all oyster bar and other boundaries established by the Commission, one set being filed in the archives of the Coast and Geodetic Survey, at Washington, and the other set in the archives of the Shell Fish Commission.

#### PROGRESS MAPS.

The progress map to be found at the end of this publication is on a scale of 1 part in 100,000, and shows in outline the work accomplished by the United States Coast and Geodetic Survey in St. Marys County and contiguous waters. It gives the scheme of all the charts and smooth projections constructed in connection with the survey, the location and names of all triangulation stations used as a basis for the surveying work, and the "boundaries of county waters" established by the Commission for the purpose of carrying out the laws of Maryland relating to oyster culture.

Besides indicating the amount of work done by the Coast and Geodetic Survey in connection with the work of the Shell Fish Commission, this progress map will be of special value for index purposes to engineers and others searching for the particular chart or projection covering the locality of the oyster bars or landmarks that may be under consideration.

The progress maps<sup>2</sup> accompanying the first and second annual reports of the Maryland Shell Fish Commission were prepared under the direction of the hydrographic engineer of the Commission. They are on the scale of 1 part in 400,000, and show the outline of the tidewater counties of Maryland, with shaded areas to indicate the waters already covered by the operations of the oyster survey.

<sup>1</sup> For the scheme of these projections see the progress map at the end of this publication.

<sup>2</sup> These maps and reports can be obtained by application to Maryland Shell Fish Commission, Marine Bank Building, Baltimore, Md.

BOUNDARIES OF THE COUNTY WATERS.<sup>1</sup>

## WATERS WITHIN TERRITORIAL LIMITS OF COUNTY.

The laws of Maryland relating to oyster culture provide that "no person shall be permitted, by lease, assignment, or in any other manner, to acquire a greater amount of land than ten acres situated within the territorial limits of any of the counties, or one hundred acres in any other place."

The boundary line<sup>2</sup> between the waters "within the territorial limits" of St. Marys County and the waters in "any other place," as established by the Shell Fish Commission for the purpose of carrying out the oyster laws, and delineated on the "oyster charts" and the smooth projections of the Coast and Geodetic Survey, is technically described and defined as follows:

*Patuxent River waters of St. Marys County.*—Following the boundary line between St. Marys County and Charles County along the middle of Indian Creek as laid down on Chart No. 19, Natural Oyster Bars, Maryland, to a point defined by the intersection of this boundary line with the boundary line in the Patuxent River between Calvert County on one side and Charles and St. Marys counties on the other side as laid down on Chart No. 19, Natural Oyster Bars, Maryland; thence down the channel of Patuxent River following the channel boundary line between St. Marys and Calvert counties as laid down on Charts Nos. 19 and 20, Natural Oyster Bars, Maryland, to a point in the mouth of Patuxent River defined by the intersection of this boundary line with a straight line connecting a point defined by latitude  $38^{\circ} 19' 09.8''$  and longitude  $76^{\circ} 25' 21.0''$ <sup>3</sup> situated on Drum Point and a point defined by latitude  $38^{\circ} 18' 35.9''$  and longitude  $76^{\circ} 23' 59.8''$  situated on Hog Point; thence along a straight line ending at a point defined by latitude  $38^{\circ} 18' 35.9''$  and longitude  $76^{\circ} 23' 59.8''$  situated on Hog Point on the southern side of the entrance to Patuxent River.

*Chesapeake Bay waters of St. Marys County.*—Commencing at a point defined by latitude  $38^{\circ} 18' 35.9''$  and longitude  $76^{\circ} 23' 59.8''$  situated on Hog Point on the southern side of the entrance to Patuxent River; thence along the mean low water line of the Chesapeake Bay shore of St. Marys County across the mouth of all inlets less than 100 yards in width, around Cedar Point and Point No Point, across the mouth of St. Jerome Creek, and around Point Look-in to a point defined by latitude  $38^{\circ} 02' 11.0''$  and longitude  $76^{\circ} 19' 20.8''$  situated on Point Lookout on the northern side of the mouth of Potomac River.

*Potomac River waters of St. Marys County.*—Commencing at a point defined by latitude  $38^{\circ} 02' 11.0''$  and longitude  $76^{\circ} 19' 20.8''$  situated on Point Lookout on the northern side of the mouth of Potomac River; thence along the mean low-water line of the Potomac River shore of St. Marys County across the mouth of all inlets less than 100 yards in width, around Cornfield Harbor and Cornfield Point to a point defined by latitude  $38^{\circ} 04' 53.4''$  and longitude  $76^{\circ} 22' 24.2''$  situated on a point on the south side of the entrance to Briscoe Creek; thence in a straight line across the mouth of Briscoe Creek to a point defined by latitude  $38^{\circ} 05' 05.4''$  and longitude  $76^{\circ} 22' 35.3''$  situated on a point on the north side of Briscoe Creek; thence along the mean low-water line of the Potomac River shore of St. Marys County across the mouth of all inlets less than 100 yards in width, to a point defined by latitude  $38^{\circ} 05' 14.6''$  and longitude  $76^{\circ} 22' 47.8''$  situated on the southeastern side of the entrance to Harry James Creek; thence in a straight line across the mouth of Harry James Creek to a point defined by latitude  $38^{\circ} 05' 27.6''$  and longitude  $76^{\circ} 23' 16.5''$  situated on the northwestern side of the entrance to Harry James Creek; thence along the mean low-water line of the Potomac River shore of St. Marys County across the mouth of all inlets less than 100 yards in width, to a point defined by latitude  $38^{\circ} 05' 37.8''$  and longitude  $76^{\circ} 23' 33.2''$  situated on Grays Point on the eastern side of Calvert Bay entrance to Smiths Creek;

<sup>1</sup> For a complete historical and legal description of the boundaries of the counties of Maryland, the valuable publication entitled "The Counties of Maryland—Their Origin, Boundaries, and Election Districts," prepared by Dr. Edward B. Mathews and published by the Maryland Geological Survey under the direction of Dr. William Bullock Clark, superintendent, should be consulted, as the boundaries described in this publication have been established and technically defined for the purpose of carrying out the oyster laws of the State, and may or may not be correct for other purposes.

<sup>2</sup> See Charts of Natural Oyster Bars, published by the Coast and Geodetic Survey, and the progress map at the end of this publication.

<sup>3</sup> Latitudes and longitudes based on the United States standard datum of the U. S. Coast and Geodetic Survey.

thence in a straight line across the mouth of Smiths Creek to a point defined by latitude  $38^{\circ} 06' 12.8''$  and longitude  $76^{\circ} 25' 05.0''$  situated on Kitts Point on the western side of the entrance to Smiths Creek; thence along the mean low-water line of the Potomac River shore of St. Marys County across the mouth of all inlets less than 100 yards in width, to a point defined by latitude  $38^{\circ} 06' 18.0''$  and longitude  $76^{\circ} 25' 18.4''$  situated on Kitts Point on the eastern side of the entrance to St. Marys River; thence in a straight line across the mouth of St. Marys River to a point defined by latitude  $38^{\circ} 06' 18.8''$  and longitude  $76^{\circ} 27' 53.9''$  situated on a point on the southeast side of St. Georges Island on the western side of the entrance to St. Marys River; thence along the mean low-water line of the Potomac River shore of St. Marys County across the mouth of Island Creek and other inlets less than 100 yards in width, to a point defined by latitude  $38^{\circ} 08' 04.2''$  and longitude  $76^{\circ} 29' 58.6''$  on the southeastern side of the Potomac River entrance to the straits between St. Georges Island and the mainland leading into St. Georges River; thence in a straight line across the straits separating St. Georges Island from the mainland to a point defined by latitude  $38^{\circ} 08' 15.9''$  and longitude  $76^{\circ} 30' 07.2''$  situated on the northwestern side of the Potomac River entrance to the straits between St. Georges Island and the mainland leading into St. Georges River; thence along the mean low-water line of the Potomac River shore of St. Marys County around Piney Point and across the mouth of Herring Creek, Blake Creek, Poplar Hill Creek, and other inlets less than 100 yards in width, to a point defined by latitude  $38^{\circ} 13' 58.3''$  and longitude  $76^{\circ} 41' 13.3''$  situated on Higgins Point on the eastern side of the entrance to Bretons and St. Clement bays; thence in a straight line across the Heron Island Sound entrance to Bretons and St. Clement bays to a point defined by latitude  $38^{\circ} 12' 54.7''$  and longitude  $76^{\circ} 43' 12.0''$  situated on the eastern extremity of the sand bar known as Heron Island; thence in a straight line along the center of Heron Island to a point defined by latitude  $38^{\circ} 13' 07.7''$  and longitude  $76^{\circ} 43' 51.7''$  situated on the western extremity of the sand bar known as Heron Island; thence in a straight line across the Heron Island Sound entrance to St. Clement and Bretons bays to a point defined by latitude  $38^{\circ} 12' 30.7''$  and longitude  $76^{\circ} 44' 34.8''$  situated on the southeastern end of Blakistone Island; thence along the mean low-water line of the Potomac River shore of Blakistone Island of St. Marys County around Blakistone Island Light and across all inlets less than 100 yards in width to a point defined by latitude  $38^{\circ} 12' 50.8''$  and longitude  $76^{\circ} 44' 59.0''$  situated on the northwestern end of Blakistone Island on the southeastern side of Dukehart Channel; thence in a straight line across the Dukehart Channel entrance to St. Clement and Bretons bays to a point defined by latitude  $38^{\circ} 13' 10.8''$  and longitude  $76^{\circ} 45' 09.9''$  situated on the mainland on the northwest side of Dukehart Channel; thence along the mean low-water line of the Potomac River shore of St. Marys County across the mouth of Dukehart Creek and other inlets less than 100 yards in width to a point defined by latitude  $38^{\circ} 13' 39.7''$  and longitude  $76^{\circ} 46' 39.9''$  situated on the eastern side of the eastern St. Catherine Sound entrance to Wicomico River.

*Wicomico River waters of St. Marys County.*—Commencing at a point defined by latitude  $38^{\circ} 13' 39.7''$  and longitude  $76^{\circ} 46' 39.9''$  situated on the eastern side of the eastern St. Catherine Sound entrance to Wicomico River; thence in a straight line across the eastern St. Catherine Sound entrance to Wicomico River to a point defined by latitude  $38^{\circ} 13' 42.2''$  and longitude  $76^{\circ} 47' 17.5''$  situated on the extreme southeast end of the sand bar making out from the southeast end of St. Catherine Island; thence along a line on the center of the sand bar making out from the southeast end of St. Catherine Island as laid down on Chart No. 26, Natural Oyster Bars, Maryland, to a point defined by latitude  $38^{\circ} 14' 02.6''$  and longitude  $76^{\circ} 47' 32.6''$  situated on the southeastern end of St. Catherine Island; thence along the mean low-water line of the Potomac River shore of St. Catherine Island of St. Marys County across all inlets less than 100 yards in width to a point defined by latitude  $38^{\circ} 14' 28.9''$  and longitude  $76^{\circ} 48' 10.9''$  situated on the northwestern end of St. Catherine Island; thence in a straight line to a point in the mouth of Wicomico River defined by the intersection of the boundary line down the middle of Wicomico River between St. Marys and Charles counties as laid down on "Chart No. 26, Natural Oyster Bars, Maryland," and a straight line between a point on the northwestern end of St. Catherine Island defined by latitude  $38^{\circ} 14' 28.9''$  and longitude  $76^{\circ} 48' 10.9''$  and the center point of Cobb Point Bar Light defined by latitude  $38^{\circ} 14' 33.3''$  and longitude  $76^{\circ} 49' 36.9''$ ; thence following the boundary line between St. Marys County and Charles County along the middle of Wicomico River as laid down on "Chart No. 26, Natural Oyster Bars, Maryland," to the end of the water boundary between St. Marys County and Charles County on the northeastern side of the upper Wicomico River as laid down on "Chart No. 26, Natural Oyster Bars, Maryland."

## WATERS CONTIGUOUS TO COUNTY.

The oyster laws of Maryland provide that a true and accurate delineation of all natural oyster bars shall be made on copies of charts of the United States Coast and Geodetic Survey, "which said copies shall be filed in the office of the said Commissioners," and "in the office of the clerks of the circuit courts for the respective counties wherein the grounds so designated may lie."

For the purpose of carrying out the latter part of this section of the law and for the purpose of establishing the limits of the oyster-culture area to be opened up for leasing with each county surveyed, it is necessary for the Shell Fish Commission to establish a boundary line between the waters contiguous to but not within the territorial limits of each county and the waters contiguous to but not within the territorial limits of adjacent counties.

This boundary line has been delineated on the "Charts of Natural Oyster Bars," published by the Coast and Geodetic Survey, and is technically described and defined as follows:

Commencing at a point located at the mouth and near the middle of Patuxent River defined by the intersection of Patuxent River channel boundary line between Calvert County and St. Marys County as laid down on Chart No. 20, Natural Oyster Bars, Maryland, and the straight line between a point situated on Hog Point on the southern side of the entrance to Patuxent River defined by latitude  $38^{\circ} 18' 35.9''$  and longitude  $76^{\circ} 23' 59.8''$ <sup>1</sup> and a point situated on Drum Point on the northern side of the entrance to Patuxent River defined by latitude  $38^{\circ} 19' 09.8''$  and longitude  $76^{\circ} 25' 21.0''$ ; thence along the Chesapeake Bay boundary between Calvert and St. Marys counties as laid down on "Chart No. 20, Natural Oyster Bars, Maryland," to a point defined by latitude  $38^{\circ} 19' 37.7''$  and longitude  $76^{\circ} 19' 19.0''$  situated about  $5\frac{1}{4}$  miles southeast of Cove Point Light and  $5\frac{1}{4}$  miles east by north of Drum Point Light; thence along the Chesapeake Bay boundary between St. Marys and Dorchester counties as laid down on "Chart No. 20, Natural Oyster Bars, Maryland," to a point defined by latitude  $38^{\circ} 17' 58.0''$  and longitude  $76^{\circ} 18' 59.7''$  situated about  $2\frac{3}{4}$  miles east of Cedar Point Light; thence along the Chesapeake Bay boundary between St. Marys and Dorchester counties as laid down on "Charts Nos. 20, 21, and 22, Natural Oyster Bars, Maryland," to a point defined by latitude  $38^{\circ} 04' 34.8''$  and longitude  $76^{\circ} 12' 01.0''$  situated near the middle of Chesapeake Bay near a shoal marked by a red buoy of the U. S. Bureau of Lighthouses, which is about  $5\frac{3}{8}$  miles west by north of Holland Island Bar Light and  $7\frac{1}{8}$  miles east by north of Point Lookout Light; thence with the waters of Chesapeake Bay in a straight line between Somerset County and St. Marys County as laid down on "Charts Nos. 22 and 23, Natural Oyster Bars, Maryland," to a point on Smith Point defined by the intersection of the straight line Maryland-Virginia boundary across Chesapeake Bay and the mean low-water line of the southern shore of Potomac River; thence in a straight line across the mouth of Potomac River along the line dividing the "waters of the Potomac River under the joint jurisdiction of Maryland and Virginia as to fisheries" from the waters of St. Marys County in Chesapeake Bay, as laid down on "Chart No. 23, Natural Oyster Bars, Maryland," to a point defined by latitude  $38^{\circ} 02' 11.0''$  and longitude  $76^{\circ} 19' 20.8''$  situated on Point Lookout on the northern side of the mouth of Potomac River.<sup>2</sup>

<sup>1</sup> Latitudes and longitudes based on the United States standard datum of the United States Coast and Geodetic Survey.

<sup>2</sup> The waters of the Potomac River, although belonging to the State of Maryland, are under the joint jurisdiction of Maryland and Virginia as to fisheries, and for this reason the Maryland Shell Fish Commission did not consider it necessary to define the "waters contiguous to St. Marys County" lying in the Potomac River.

## LANDMARKS (UNITED STATES COAST AND GEODETIC SURVEY TRIANGULATION STATIONS).

### EXPLANATION.

The oyster laws of Maryland authorizing the survey to be made by the Shell Fish Commission provide for "an accurate report of said survey, setting forth such a description of landmarks as may be necessary to enable the said board, or their successors, to find and ascertain the boundary lines of said natural oyster beds, bars, and rocks, as shown by delineation on the maps and charts." The law of the United States authorizing the cooperation of the Department of Commerce and Labor in the survey of natural oyster bars of Maryland provides for the erection of "such structures as may be necessary to mark the points of triangulation, so that the same may be used for such future work of the Coast and Geodetic Survey as the said bureau may be hereafter required to perform in prosecuting the Government coast survey of the navigable waters of the United States located within the State of Maryland."

Under the provisions of the sections of the laws stated above, the markings and descriptions of landmarks must be sufficient for the present and future needs of both the Government and the State. With this end in view, considerable work has been expended in erecting permanent monuments at the triangulation stations and in the proper description of their location.

An effort has been made to arrange the descriptions of location and character of landmarks in a uniform and logical manner. The descriptions start with the assumption that the individual seeking a landmark has only an indefinite idea of its location. They gradually proceed from description of the general locality of a landmark to the descriptions of its immediate surroundings. This is followed by specific details of the character of the center and reference marks and a "round" of reference angles and distances which in themselves frequently contain enough information to furnish an independent and reliable location of the triangulation station.

### METHOD OF DESCRIBING TRIANGULATION STATIONS.

*The separate descriptions of triangulation stations should not be used without reading the following explanation of the method of describing the triangulation stations, as it contains certain details that are common to all the landmarks described in this publication and which are omitted in the separate descriptions as being needless repetitions:*

*Name.*—The title at the top of each separate description is the name by which the landmark or triangulation station is known and designated in all work and published oyster records or oyster charts of both the Government and State. The selection of the name is usually left to the triangulator establishing the station, and it may or may not have geographic or other significance in reference to the locality.

*General locality.*—Under this heading is given the general locality of the landmark in reference to well-known and prominent natural or artificial features, such as the

nearest body of water, town, river, steamer wharf, well-defined point of land, church, or any other feature that is likely to remain both permanent and prominent.

This heading also covers a reference to the published chart or map which shows the location of the station most clearly. Nearly all the triangulation stations described in this publication are plainly indicated by name and a triangulation symbol on the published charts of oyster bars of Maryland. In this case they are referred to by serial number only, the words "charts of oyster bars of Maryland" being omitted to avoid needless repetition. These published oyster charts are on the large scale of 1 part in 20,000 (approximately  $3\frac{1}{8}$  inches to a statute mile) and show the location of the triangulation stations so clearly that in many cases the written descriptions will not be required to find them.

*Immediate locality.*—Under this heading is given the description of the "observed station" in reference to its immediate surroundings. This is supposed to include a statement of the station's estimated elevation above high water or some other well-defined level of the locality, such as a road or house; the character of the ground on which it is located, such as marsh land, sand beach, cultivated field, or meadow; estimated bearings in points of the compass and estimated distances in yards *from* (not *to*) easily recognized features, such as extreme end of point, edge of bluff, bank of creek, line of telephone poles, shore line, barn, house, fence, ditch, trees, or any other definite detail, such as being on range with the tangent of an island and a church; and so forth.

When a standard monument has been established near the station as a "reference station," this heading also covers a statement of the true bearing of the monument in degrees and minutes and its measured distance in meters, as it is the first object that is likely to catch the eye when the immediate vicinity of the desired station is reached and might be mistaken for the center mark of the "observed station" unless special attention is called to it.

The distinction between the "observed station" and "reference station" should be carefully noted by anyone making use of the description of stations for any future surveying operations.

The "observed station" is located at the particular triangulation point covered by the description of stations, and is the one whose geographic position is first computed, as it is the point which was "occupied" and "observed on" for horizontal angles. However, in spite of the primary importance of the location of the "observed station," it will be noted from the description of stations that frequently it is not marked as well as the "reference station," and in many instances has only a pine stub to indicate its position. This is the case for the reason that the necessity of intervisibility of landmarks usually made it compulsory to locate "observed stations" on edges of banks and ends of points of land, which in the tidewater section of Maryland generally means they will be washed away in a short period of years. The past experience of the Coast and Geodetic Survey in this region has shown the great need of "reference stations," if the frequent reestablishment of a new framework of triangulation is to be avoided.

The chief reason and need for the establishment of the "reference station," or secondary station, as it might be well named, is explained in the preceding paragraph, but in several instances other reasons, such as the location of the "observed station" on an unstable sand dune, in a cultivated field, in front of a residence, or other places

objectionable to the landowner, have led to establishment of "reference stations." The location of the "reference station" in relation to the "observed station" is fixed for plotting on charts or for computation of its geographic position by checked measurements of its distances and azimuth from the "observed station."<sup>1</sup>

*Marks.*—Under this heading is given a description of the character of the permanent monuments or other marks of the location of the "observed station," and of the "reference station" where one has been established.

All the marks designated in the descriptions as "the center point of triangle on standard cement monument" are exactly alike. These monuments are made of cement, sand, and gravel, and are 2 feet long and 8 inches square at top and bottom. Their tops are all marked with the same brass mold and show a center hole surrounded by a triangle, with the letters "M. S. F. C." arranged around the vertex and the letters "U. S. C. S." underneath the base of the triangle. The center hole is always in the center of the top of the monument by construction, and if this is found to have been broken off without disturbing the bottom the center of its square section can be used as the location of the station.

All the "standard cement monuments," whether used for marking the "observed station" or "reference station," have been planted upright in exactly the same manner, with their tops projecting 3 or 4 inches above the surface of the ground, unless otherwise stated.

Therefore, as the above facts in reference to the "standard cement monuments" are a constant element in all cases, the repetition of these facts in the description of stations is made needless by this one statement.

*References.*—Under this heading are given the "rounds" of directions and distances to all objects that might be useful in locating the stations when the surface marks can not be found. It is also contemplated that for general purposes of topography, hydrography, or location of boundaries of oyster bars these references will be sufficient in many cases to relocate the position of an "observed station" or "reference station" when both of them have been destroyed.

The first reference object given in the descriptions is always a triangulation station visible from the station being described, this, if possible, being a lighthouse, church spire, or other permanent and prominent point. Its direction is taken as being  $0^{\circ} 00' 00''$ , and the directions of all other objects are measured from it as an initial point, the angles being taken in a clockwise direction (left to right).

The true bearing<sup>2</sup> of the initial object is always given in parentheses alongside its name. This furnishes means for the calculation of the bearings of any of the other reference objects for the purposes of locating a station by horizontal angles or for the relocation of corner buoys of oyster-bar boundaries by the method of compass directions described in this publication under the heading of "Boundaries of oyster bars."

The distances in the last column under "References" are given in three different units, which vary according to their accuracy. The "miles" are statute miles and may be considered only as rough estimates. The "yards" are more accurate, but must be

<sup>1</sup> Geographic coordinates (latitude, longitude, distance, and azimuth) relating to any of the "observed stations" or of the "reference stations" described in this publication can be obtained by application to the Superintendent of the Coast and Geodetic Survey, at Washington, D. C.

<sup>2</sup> The mean magnetic variation for St. Marys County was  $5^{\circ} 25'$  west of north in 1910 and increasing at the rate of  $4'$  yearly.

looked on as results generally obtained by pacing or careful estimating. The "meters," however, are accurate to the degree indicated by their decimals and in every case have been measured with a steel tape. In the same manner the accuracy of the directions are indicated by the refinement of angular measure with which they are recorded.

## DESCRIPTIONS OF TRIANGULATION STATIONS.

## PRINCE.

*General locality.*—Western shore of Patuxent River about one-fourth of a mile north of mouth of Swanson Creek. (See chart No. 19.)

*Immediate locality.*—Observed station is in pasture about 20 feet above high water, 15 yards northwest of edge of bank, 75 yards northeast of a grove of trees and 100 yards southwest of another grove of trees. Locust trees form a fringe along edge of bank.

*Marks.*—Observed station is center point of triangle on standard cement monument.

*References.*—

## LEITCH.

*General locality.*—Eastern shore of Patuxent River on prominent point opposite mouth of Swanson Creek given on chart as Gods Grace Point but known locally as Leitchs Point. (See chart No. 19.)

*Immediate locality.*—Observed station is on sand and grass land about 1 foot above high water and 3 yards north of straight line connecting two round points. It is about 13 yards northwest of the lower of these two points and 9 yards east of upper point. A creek 3 feet wide has its mouth about 19 yards east by south of the station. There are no permanent objects near station.

*Marks.*—Observed station is center point of triangle on standard cement monument.

## FODDER.

*General locality.*—Western shore of Patuxent River on the southern side of the mouth of Swanson Creek, about 1 mile west-southwest of Leitch Wharf and three-fourths of a mile west-northwest of Point Judith (locally known as Teague Point). (See chart No. 19.)

*Immediate locality.*—Observed station is on the edge of cultivated land about 10 feet above high-water mark, 4 yards west of edge of bank, and 9 yards north of another edge. Cement monument marking reference station is 15.21 meters S 60° 52' W of observed station.

*Marks.*—Observed station is center point of triangle on standard cement monument with a top 9 inches square and 8 inches above surface of ground. Reference station is center point of triangle on standard cement monument with a top about 8 inches square and 5 inches above surface of ground.

## BUENA.

*General locality.*—Eastern shore of Patuxent River, about 1 1/4 miles northeast of Benedict, at place known as Buena Vista. (See chart No. 19.)

*Immediate locality.*—Observed station is in a field on land adjoining house owned by S. V. Smith and occupied by Dr. Huggins. It is about 10 feet above high water, 8 yards east of edge of bank, and 12 yards south of a rail fence. Cement monument marking reference station is 11.11 meters N. 5° 42' E. of observed station and near fence.

*Marks.*—Observed station is nail in stub with top 2 inches above ground. Reference station is center point of triangle on standard cement monument.

TEAGUE.

*General locality.*—Western shore of Patuxent River, on point on southern side of entrance to Swan-son Creek, locally known as Teague Point, and given on chart as Point Judith. (See chart No. 19.)

*Immediate locality.*—Observed station is on gravel and grass land about 3 feet above high water, about 11 yards from south side, 16 yards from north-northeast side, and 75 yards west by north of extreme end of point. Bushes stand between station and north side of point. There are no permanent reference objects near station.

*Marks.*—Observed station is center point of triangle on standard cement monument.

CATHOLIC CHURCH CROSS (BENEDICT).

*General locality.*—Western shore of upper Patuxent River, in the town of Benedict. (See chart No. 19.)

*Immediate locality.*—Observed station is on Catholic Church, located on the main street of the town of Benedict, about one-fourth mile from the wharf.

*Marks.*—Observed station is center point of cross on church.

*References.*—None necessary.

CITY.

*General locality.*—Western shore of Patuxent River, on Town Point, about one-fourth mile north-northeast of Benedict steamboat wharf. (See chart No. 19.)

*Immediate locality.*—Observed station is on gravel and shell point, about 4 feet above high water, 12 yards northwest of the shore, 63 yards west-southwest of a shanty, about 100 yards west-southwest of extreme end of point, and 11 yards southeast of a slough. There are no permanent reference objects near station.

*Marks.*—Observed station is center point of triangle on standard cement monument.

## INDIAN.

*General locality.*—Western shore of Patuxent River on north side of entrance to Indian Creek and about one-fourth mile below Benedict steamboat wharf. (See chart No. 19.)

*Immediate locality.*—Observed station is about 3 feet above high water, 7 yards west of shore, 16 yards northeast of a fence and a line of trees, 13 yards southwest of a lone locust tree, about 250 yards to the south-southeast of a large square house, and 125 yards east-northeast of another house.

*Marks.*—Observed station is center point of triangle on standard cement monument.

DWARF.

*General locality.*—Eastern shore of Patuxent River about 2 miles north-northwest of Sheridan Point and about 1½ miles southeast of Benedict, on a point of land opposite the mouth of Indian Creek. (See chart No. 19.)

*Immediate locality.*—Observed station is on sand and grass land about 1 foot above high-water mark, 6 yards northeast from extreme end of point, 4 yards east of one edge of shore and 6 yards north of another edge of shore. Point on which station is located has a sugar-berry tree, several small locust trees and water bushes, and a pond behind bushes and trees about 100 yards to the east.

*Marks.*—Observed station is center point of triangle on standard cement monument.

## BUZZ.

*General locality.*—Northeast shore of Patuxent River on southwest side of Buzzards Island near mouth of Buzzards Island Creek. (See chart No. 19.)

*Immediate locality.*—Observed station is on marsh, clay, and grass land on wooded island about 2 feet above high water, 5 yards northeast of river shore and 40 yards northwest of extreme point of island. Cement monument marking reference station is 8.97 meters N.  $42^{\circ} 23'$  E. of observed station.

*Marks.*—Observed station is nail in stub with top flush with ground. Reference station is center point of triangle on standard cement monument.

*References.*—

## SWEEP.

*General locality.*—Northeast shore of Patuxent River on northwest side of mouth of Island Creek near inner end of neck of land joining Broome Island to the mainland. (See chart No. 19.)

*Immediate locality.*—Observed station is in a field about 4 feet above high water, 4 feet northwest of a wire fence, 24 yards south by west of a stable, 60 yards south-southwest of a house, and 100 yards south-southeast of a pine grove. Cement monument marking reference station is 21.70 meters N. 59° 39' E. of station and near fence line.

*Marks.*—Observed station is the center of an oblong wooden box 4 inches square with top 4 inches above the ground. Reference station is center point of triangle on a standard cement monument.

## ISLAND.

*General locality.*—Northeast shore of Patuxent River on the extreme southeast point of land about one-half mile to the east of the mouth of Island Creek. (See chart No. 19.)

*Immediate locality.*—Observed station is on a marshy point at about extreme high-water mark, 30 yards north of extreme end of point, 25 yards east of one side of point, and 20 yards west of another side of point. Old tile pipe used as a reference station is 16.98 meters N. 12° 39' E. and cement monument marking new reference station is 30.93 meters N. 2° 40' E. of observed station.

*Marks.*—Observed station is nail in stub with top flush with marsh. Old reference station is center of 4-inch tile pipe set in cement with top projecting about 10 inches above ground. New reference station is center point of triangle on standard cement monument.

PEAK.

*General locality.*—Northeast shore of Patuxent River, about in middle of inner shore of a large bay between St. Leonard and Island creeks. (See chart No. 19.)

*Immediate locality.*—Observed station is on Parran house, located near shore at extreme end of a road leading to Wallville.

*Marks.*—Observed station is ball on tip of tower.

*References.*—None necessary.

COLE.

*General locality.*—Southwest shore of Patuxent River, about one-fourth mile northwest of Cole Creek. (See chart No. 19.)

*Immediate locality.*—Observed station is about 35 feet above high-water mark on a grass peninsula, 3 yards south-southwest of edge of a bluff which is washing rapidly, 8 yards west of extreme edge of bluff, where it turns inland and is not washing, but slopes gradually to the water, 8 yards north of another edge of the bluff, 10 yards northwest of trees on slope of bank, and 20 yards west of a cherry tree 2 feet in diameter. Cement monument marking reference station is 13.53 meters S. 83° 10' W. of observed station and nearly on line with large cherry tree.

*Marks.*—Observed station is nail in stub with top flush with ground. Reference station is center point of triangle on standard cement monument.

## STUMP.

*General locality.*—Northeast shore of Patuxent River about one-half mile northwest of Hellen Creek. (See chart No. 20.)

*Immediate locality.*—Observed station is on a bank about 20 feet above high water, 10 yards north-northeast of edge of bank at extreme end of point, about 20 yards southeast of edge of bank, and about 150 yards northwest of a clump of cedar and locust trees at edge of bank. Cement monument marking first reference station is 11.29 meters N. 61° 51' E. of observed station with top 10 inches below surface of field. Cement monument marking second reference station is 2.62 meters N. 60° 42' E. of observed station on line with first reference station.

*Marks.*—Observed station is center of 4-inch tile pipe set in cement with top flush with ground. First reference station is center point of triangle on standard cement monument with top 10 inches below the surface of ground. Second reference station is center point of triangle on standard cement monument with top 6 inches above surface of ground.

#### CATHOLIC CHURCH CROSS.

*General locality.*—Southeast side of Patuxent River, about halfway to Back Creek and three-fourths mile northwest of Solomons Wharf. (See chart No. 20.)

*Immediate locality.*—Observed station is on Catholic Church, known as St. Marys Star of the Sea, located in small village of Johnstown, on mainland near Solomons Island, and about 250 yards north of causeway to Solomons Island.

*Marks.*—Observed station is center of cross on bell cupola.

*References.*—None necessary.

#### CABLE.

*General locality.*—Southwest shore of Patuxent River, on east side of entrance to Kings Creek, and about three-fourths mile west of Town Point. (See chart No. 20.)

*Immediate locality.*—Observed station is on pasture land near the end of high land at the beginning of a long, low peninsula which almost closes the mouth of Kings Creek, about 30 feet above high-water mark, about 20 yards south of edge of bank on river side, about 15 yards east northeast of edge of bank on creek side, 38 yards southeast of extreme edge of top of bank, and 30 yards west of a persimmon tree.

*Marks.*—Observed station is center point of triangle on standard cement monument buried with top 10 inches below the surface of ground.

METHODIST EPISCOPAL CHURCH (SOLOMONS).

*General locality.*—Northeastern shore of Patuxent River, on upper end of Solomons Island, about one-half mile northwest of Sandy Point. (See chart No. 20.)

*Immediate locality.*—Observed station is on Methodist Church at upper end of Solomons Island near beginning of causeway to mainland.

*Marks.*—Observed station is tip of pyramidal tower on Methodist Church.

*References.*—None necessary.

KNIGHTS OF PYTHIAS FLAGSTAFF (SOLOMONS).

*General locality.*—Northeastern side of Patuxent River, on Solomons Island, in the town of Solomons. (See chart No. 20.)

*Immediate locality.*—Observed station is on flagstaff in front of Knights of Pythias Building.

*Marks.*—Observed station is center of flagstaff at about the same height as roof of the Knights of Pythias hall.

*References.*—None necessary.

## SAND.

*General locality.*—Northeastern side of Patuxent River on Sandy Point on extreme southern point of Solomons Island. (See chart No. 20.)

*Immediate locality.*—Observed station is on pasture land about 5 feet above high water, 30 yards north of extreme point of planking protecting the shore from washing, 15 yards northeast of the extreme edge of sand and grass line, and about 13 yards east of top of bank. Cement monument marking reference station is 13.64 meters N.  $2^{\circ} 19' E.$  of observed station.

*Marks.*—Observed station is nail in southwest side of a 6-inch pile driven into ground with top 6 inches above the surface. Reference station is center point of triangle on standard cement monument.

*References.*—

## FISHSTACK.

*General locality.*—Northeastern side of Patuxent River on northeastern side of entrance to Mill and Back creeks. (See chart No. 20.)

*Immediate locality.*—Observed station is on mainland on fish fertilizer factory located on opposite side of creek from Solomons Island.

*Marks.*—Observed station is center of smokestack on fish factory.

*References.*—None necessary.

## BON.

*General locality.*—North shore of Patuxent River about  $1\frac{1}{4}$  miles west-northwest of Drum Point Light and about  $\frac{1}{2}$  mile east-northeast of Solomons Island. (See chart No. 20.)

*Immediate locality.*—Observed station is on cultivated land, about 5 feet above high water, about 7 yards north of shore, about 90 yards southeast of a  $1\frac{1}{2}$ -story house on land 10 feet higher than station, and about 75 yards south of a  $1\frac{1}{2}$ -story brick house. Cement monument marking reference station is 0.67 meter N.  $45^{\circ} 29' E.$  of observed station.

*Marks.*—Observed station is an inverted nail in center of cement in a 6-inch tile pipe with top flush with surface of ground. Reference station is center point of triangle on standard cement monument.

BAREDA HOUSE CUPOLA.

*General locality.*—North side of Patuxent River about one-half mile northwest of Drum Point Light. (See chart No. 20.)

*Immediate locality.*—Observed station is on Bareda House which is a large 3-story square mansion with square cupola with three windows on each side and a porch all around ground floor, located about 100 yards back from shore on high land.

*Marks.*—Observed station is center of ornamental design of four brackets on center of cupola.

*References.*—None necessary.

DRUM POINT LIGHT.

*General locality.*—Northeastern side of entrance of Patuxent River and a short distance off shore from Drum Point. (See chart No. 20.)

*Immediate locality.*—Observed station is on a screw pile structure known as Drum Point Lighthouse.

*Marks.*—Observed station is center of black lantern on Drum Point Lighthouse.

BEN.

*General locality.*—Southwestern shore of Patuxent River about 1 mile south-southwest of Sandy Point and 1¼ miles south-southeast of Town Point. (See chart No. 20.)

*Immediate locality.*—Observed station is on a clay and sand bluff in a cultivated field, about 20 feet above high-water mark, about 10 feet west of edge of bank, 3 feet south of point covered with scrub pines, about 15 yards northeast of one edge of plateau, 10 yards southeast of another edge of plateau, about 65 yards north of point of woods, and 10 yards south of cut in bank which is washing rapidly. Cement monument marking reference station is 8.42 meters S. 56° 15' W. of station.

*Marks.*—Observed station is nail in cement in 6-inch tile pipe with top flush with ground. Reference station is center point of triangle on standard cement monument.

## CARROLL 2.

*General locality.*—South side of Patuxent River, about 1 mile south-southwest of Hog Point and about 1 mile south of Drum Point Light. (See chart No. 20.)

*Immediate locality.*—Observed station is on a sandy clay bluff in a cultivated field, about 50 feet above high-water mark, 4 feet south of top edge of bluff, 180 yards east of trees and ravine beyond cultivated field, 60 yards west of trees and ravine beyond cultivated field, 300 yards north of large square chimney on old-fashioned farmhouse, and 250 yards north of large tree to right of farmhouse. Cement monument marking reference station is 13.32 meters S.  $54^{\circ} 30'$  W. of observed station. Another reference station is a nail in the east side of cement in a 6-inch tile pipe 14.64 meters S.  $13^{\circ} 20'$  E. of observed station and on range with Drum Point Light.

*Marks.*—Observed station is center of 5-inch tile pipe with top 8 inches below surface of ground. Reference station is nail in cement on east side of a 6-inch tile pipe with top 6 inches below surface of ground. Another reference station is center point of triangle on standard cement monument with top 9 inches below surface of ground.

## HOG 2.

*General locality.*—Southern shore of entrance to Patuxent River on Hog Point, about  $1\frac{3}{8}$  miles west-northwest of Cedar Point Light. (See chart No. 20.)

*Immediate locality.*—Observed station is on a sand beach at high-water mark, 30 yards northwest of point of woods, and 200 yards north-northeast of nearest shore of Parsons Creek. Cement monument marking reference station is 33.35 meters S. 42° 22' E. of observed station on a point of high land.

*Marks.*—Observed station is nail set in cement in a 6-inch tile pipe, with top 1 foot below the surface. Reference station is center point of triangle on standard cement monument.

## PAT.

*General locality.*—Western shore of Chesapeake Bay on Little Cove Point, about 1¾ miles south by west of Cove Point Light. (See chart No. 20.)

*Immediate locality.*—Observed station is on the highest point of a thickly wooded bluff, about 75 feet above high-water mark, 4 yards west of edge of bluff, and 15 yards southwest of extreme point. Cement monument marking reference station is 24.57 meters S. 71° 26' W. of observed station.

*Marks.*—Observed station is a 3-inch round stake set in cement, with top about 4 inches above surface of ground. Reference station is center point of triangle on standard cement monument.

*References.*—

## WHITE HOUSE (NORTHEAST CHIMNEY).

*General locality.*—Western shore of Chesapeake Bay about 1 mile southwest of Cove Point Light and ¼ mile southwest of Cove Point Landing. (See chart No. 20.)

*Immediate locality.*—Observed station is a chimney standing alone about 300 yards southwest of Cove Point Landing which was formerly the more northeasterly of two chimneys on a house that was destroyed by fire. This chimney is near a white house which was built to replace the destroyed house.

*Marks.*—A chimney standing apart from a small white house owned by Mrs. Hagland.

*References.*—

	°	'	''	
"Cove Point Light" (N. 39° 54' E.).....	0	00	00	1 mile.

## COVE POINT LIGHT.

*General locality.*—Western shore of Chesapeake Bay on Cove Point, which is about 5 miles to northward of entrance to Patuxent River. (See chart No. 20.)

*Immediate locality.*—Observed station is on white tower known as Cove Point Light, which is near white detached dwelling and white detached fog-signal house.

*Marks.*—Observed station is center point of black lantern on white tower.

*References.*—

	°	'	''	
"Cedar Point Light" (S. 7° 16' E.).....	0	00	00	6 miles.

## CEDAR POINT LIGHT.

*General locality.*—Western shore of Chesapeake Bay on Cedar Point,  $3\frac{3}{4}$  miles east-southeast of Drum Point Light and 6 miles south by east of Cove Point Light. (See chart No. 20.)

*Immediate locality.*—Observed station is on a brick dwelling known as Cedar Point Lighthouse.

*Marks.*—Observed station is center point of lantern on Cedar Point Lighthouse.

*Reference.*—

“Cove Point Light” (N.  $7^{\circ}$  16' W.)..... 0 00 00 ..... 6 miles.

## CAIN.

*General locality.*—Western shore of Chesapeake Bay, about  $1\frac{5}{8}$  miles southwest of Cedar Point Light. (See charts Nos. 20 and 21.)

*Immediate locality.*—Observed station is on a bank about 5 feet above high-water mark, about 20 yards northwest of ordinary high water, 5 yards northwest of extreme high water, 100 yards southwest of old-fashioned house among several large trees, and about 250 yards below small wharf and canning house. Cement monument marking reference station is 6.45 meters N.  $16^{\circ}$  56' E. of observed station.

*Marks.*—Observed station is a nail set in cement in a 3-inch pipe with top about 2 inches above ground. Reference station is center point of triangle on standard cement monument.

*References.*—

## DESERT.

*General locality.*—Western shore of Chesapeake Bay, about 3 miles south-southwest of Cedar Point Light. (See charts Nos. 20 and 21.)

*Immediate locality.*—Observed station is on sand and grass land, about 25 yards west from ordinary high-water mark, about at level of extreme high-water mark, 40 yards south of a fence, 10 yards east of a fence, 45 yards south of a creek, about 50 yards north of point of pine woods, and about 300 yards east of woods across marsh. Cement monument marking reference station is 5.29 meters N.  $31^{\circ}$  24' W. of observed station.

*Marks.*—Observed station is a 4-inch tile pipe projecting about 2 inches above surface of sand. Reference station is center point of triangle on standard cement monument.

*References.*—

## HOOPER ISLAND LIGHT.

*General locality.*—Eastern side of Chesapeake Bay off shore about  $3\frac{1}{2}$  miles west of Hooper Island and 4 miles south of Barren Island. (See chart No. 21.)

*Immediate locality.*—Observed station is on Hooper Island Lighthouse.

*Marks.*—Observed station is center point of lantern on conical tower on cylindrical foundation known as Hooper Island Lighthouse.

*References.*—

	°	'	''	
"Cedar Point Light" (N. $65^{\circ} 04'$ W.).....	0	00	00	7 miles.

## FORD.

*General locality.*—Western shore of Chesapeake Bay about  $13\frac{3}{4}$  miles south of entrance to Pine Hill Run and  $7\frac{3}{4}$  miles west of Hooper Island Light. (See chart No. 21.)

*Immediate locality.*—Observed station is in a garden about 25 feet above high water, 32 yards west of edge of bank, 40 yards northeast of near corner of a house, 4 yards north of a wire fence, 33 yards north of a paling fence, and 38 yards south of another paling fence.

*Marks.*—Observed station is center point of triangle on standard cement monument.

## REED.

*General locality.*—Western shore of Chesapeake Bay about  $6\frac{1}{2}$  miles south of Cedar Point Light,  $6\frac{3}{4}$  miles northwest of Point No Point Light, and  $7\frac{5}{8}$  miles west-southwest of Hooper Island Light. (See chart No. 21.)

*Immediate locality.*—Observed station is about 10 feet above high water, 7 yards west of edge of bluff, 65 yards north-northeast of a house, 35 yards south of a fence, 45 yards north of another fence, 45 yards northwest of a large cedar tree on edge of bluff, and 35 yards north of a line of fruit trees. Cement monument marking reference station is on a line of fruit trees  $34.13$  meters S.  $10^{\circ} 11'$  E. of observed station.

*Marks.*—Observed station is a cement block with gray iron core and nail in top. Block was formerly square, but has been broken off by plow. Reference station is center point of triangle on standard cement monument.

*References.*—

## POINT AGIN.

*General locality.*—Western shore of Chesapeake Bay about  $4\frac{5}{8}$  miles northwest of Point No Point Light,  $8\frac{3}{4}$  miles south of Cedar Point Light, and  $7\frac{3}{4}$  miles southwest of Hooper Island Light. (See chart No. 21.)

*Immediate locality.*—Observed station is near edge of dense pine woods about 5 feet above high water, 6 yards southwest of edge of bank, 10 yards south of point of curve of bank, 400 yards south of road across marsh, and 425 yards south of mouth of a sand-blocked creek. Cement monument marking reference station is 18.67 meters S.  $49^{\circ} 25'$  W. of observed station.

*Marks.*—Observed station is nail in stub with top flush with surface of ground. Reference station is center point of triangle on standard cement monument.

*References.*—

## POINT NO POINT.

*General locality.*—Western shore of Chesapeake Bay about one-eighth mile northwest of Point No Point, 2 miles northwest of Point No Point Light, and 2 miles north-northeast of entrance to St. Jerome Creek. (See chart No. 22.)

*Immediate locality.*—Observed station is partly hidden by pine and cedar trees about 10 feet above high water, 50 yards west of shore, 65 yards southwest of point where fence and shore meet, 35 yards south of a fence, 30 yards south of edge of a graveyard, and 250 yards south by east of a house. Standard cement monument marking new reference station is 5.17 meters S.  $77^{\circ} 43'$  W. of observed station. Stone monument marking old reference station is 2.44 meters north of observed station. Stone monument marking old reference station is 1.90 meters east of observed station. Stone monument marking old reference station is 1.29 meters south of observed station.

*Marks.*—Observed station is a stone cone with top 6 inches below surface of ground. Reference station is center point of triangle on standard cement monument. Three other reference stations are square stone pillars with crosses cut in their tops which are just above surface of ground.

ST. MICHAEL CATHOLIC CHURCH SPIRE.

*General locality.*—Western shore of Chesapeake Bay about one-half mile west of western and inner shore of St. Jerome Creek. (See chart No. 22.)

*Immediate locality.*—Observed station is on Catholic Church located on the east side of the main road running to Point Lookout near the village called Ridge or Friendship.

*Marks.*—Observed station is center point of spire on church.

*References.*—None necessary.

POINT LOOK-IN.

*General locality.*—Western shore of Chesapeake Bay on Point Look-in about 1¾ miles south-south-east of entrance to St. Jerome Creek and 3 miles southwest of Point No Point Light. (See chart No. 22.)

*Immediate locality.*—Observed station is on sand dune about 3 feet above high water, 8 yards west of shore, 4 yards east of slough, 56 yards southeast of point of woods, and 90 yards north of another point of woods. Cement monument marking reference station is in woods across slough 44.04 meters N. 51° 59' W. of observed station.

*Marks.*—Observed station is nail in stub with top flush with surface of ground. Reference station is center point of triangle on standard cement monument.

## POTOMAC.

*General locality.*—Western shore of Chesapeake Bay about three-fourths mile north of extreme end of Point Lookout and one-half mile north-northeast of Point Lookout Light. (See charts Nos. 22 and 23.)

*Immediate locality.*—Observed station is at upper end of pine woods about 2 feet above high water, 12 yards west by south of shore, 15 yards east-southeast of woods and edge of marsh, and 100 yards north of large pine trees. Cement monument marking reference station is 10.72 meters S.  $23^{\circ} 34'$  W. of observed station.

*Marks.*—Observed station is nail in stub with top flush with surface of ground. Reference station is center point of triangle on standard cement monument.

## HALL.

*General locality.*—Northeastern shore of Potomac River about five-eighths mile northwest of Cornfield Point and 2 $\frac{3}{4}$  miles northwest of Point Lookout. (See chart No. 22.)

*Immediate locality.*—Observed station is about 5 feet above high water, 7 yards east of edge of bank, 6 yards south-southeast of a paling fence, and 150 yards south of a large house with two-story porch. Cement monument marking reference station is 17.82 meters N.  $45^{\circ} 59'$  E. of observed station. Cemented tile pipe marking another reference station is 23.24 meters N.  $47^{\circ} 55'$  E. of observed station.

*Marks.*—Observed station is nail in 4-inch cemented tile pipe with top flush with surface of ground. One reference station is center point of triangle on standard cement monument. The other reference station is a tile pipe set in cement with top flush with surface of ground.

HALL HOUSE (MIDDLE CHIMNEY).

*General locality.*—Northeastern shore of Potomac River about five-eighths mile northwest of Cornfield Point and 2¼ miles northwest of Point Lookout. (See chart No. 22.)

*Immediate locality.*—Observed station is on a large wooden house about 150 yards inshore from the bank of river.

*Marks.*—Observed station is middle point of middle chimney on large house belonging to Mr. Hall.

*References.*—None necessary.

SIG.

*General locality.*—Northeastern shore of Potomac River on eastern side of Calvert Bay on Gray Point. (See charts Nos. 22 and 24.)

*Immediate locality.*—Observed station is in edge of a scrub growth about 15 feet above high water, and 3 feet east of edge of bank. Cement monument marking reference station is 12.75 meters N. 58° 17' E. of observed station.

*Marks.*—Observed station is nail in northern one of two stumps 2½ inches in diameter. Reference station is center point of triangle on standard cement monument.

*References.*—

SMITH POINT LIGHT.

*General locality.*—Western side of Chesapeake Bay on southern side of entrance to Potomac River offshore about 3 miles east of Smith Point. (See chart No. 23.)

*Immediate locality.*—Observed station is on a square brick tower on an octagonal brick building with a cylindrical foundation.

*Marks.*—Observed station is center point of lantern on structure known as Smith Point Lighthouse.

*References.*—

	°	'	"	
"Point Lookout Light" (N. 34° 32' W.)	0	00	00	13 miles.

RED BEACON (1908).

*General locality.*—Northeastern side of Potomac River offshore in the mouth of Smiths Creek. (See chart No. 24.)

*Immediate locality.*—Observed station is on a triangular pile structure.

*Marks.*—Observed station is center point of a small lantern on pile structure known as Smiths Creek Red Beacon.

*References.*—None necessary.

## DAGO.

*General locality.*—Eastern side of entrance to Smith Creek about one-half mile south-southwest of Millers Wharf. (See chart No. 24.)

*Immediate locality.*—Observed station is in a small garden about 6 feet above high water, 40 yards north of an old hotel, 65 yards east of shore, and 165 yards southeast of a lumber wharf. Cement monument marking reference station is on a fence line 29.41 meters N. 78° 13' W. of observed station.

*Marks.*—Observed station is tile pipe set in cement with top broken off about 9 inches below surface of ground. Reference station is center point of triangle on standard cement monument.

## TAB.

*General locality.*—Western shore of Smith Creek on second prominent point from entrance to creek about three-fourths mile west-southwest of Millers Wharf. (See chart No. 24.)

*Immediate locality.*—Observed station is about 5 feet above high water, 2 yards north of edge of bank, 5 feet south of edge of bank, 14 yards southwest of a low point, 16 yards north of another low point, 31 yards southeast of still another point, and 58 yards east of a wild-cherry tree. Cement monument marking reference station is 14.53 meters S. 61° 14' W. of observed station. Reference tile pipe filled with cement is 47.93 meters S. 61° 25' W. of observed station.

*Marks.*—Observed station is center of 4-inch tile pipe filled with cement with top flush with surface of ground. One reference station is center point of triangle on standard cement monument. Another reference station is center of cemented tile pipe flush with surface of ground.

## PIER.

*General locality.*—Eastern shore of Smith Creek at steamboat landing known as Millers Wharf. (See chart No. 24.)

*Immediate locality.*—Observed station is on snubbing post on north corner of Millers Wharf, 1.46 meters from northeast side of wharf and 0.79 meters from northwest side.

*Marks.*—None mark point where spindle was fastened to snubbing post.

*References.*—None necessary.

PIPE.

*General locality.*—Eastern shore of Smith Creek at Millers Wharf. (See chart No. 24.)

*Immediate locality.*—Observed station is on a building used for packing oysters and tomatoes near wharf at Wynne.

*Marks.*—Observed station is center of the taller and more southerly of two smoke pipes on canning house at Millers Wharf.

*References.*—None necessary.

ENOUGH.

*General locality.*—Southeastern shore of northeastern branch of Smith Creek about one-fourth mile east-northeast of Millers Wharf. (See chart No. 24.)

*Immediate locality.*—Observed station is on a lightly wooded bank about 12 feet above high water, 5 yards back from edge of bank, 40 yards southwest of a house, and 45 yards northwest of a barn. Cement monument marking reference station is near fence, 19.75 meters N. 19° 51' E. of observed station.

*Marks.*—Observed station is hole in top of a 3-inch square stub with top about 3 inches above surface of ground. Reference station is center point of triangle on standard cement monument.

## IN.

*General locality.*—Northern shore of Smith Creek on a point between two main branches of creek about one-fourth mile northwest of Millers Wharf. (See chart No. 24.)

*Immediate locality.*—Observed station is on a grass point which is surrounded by small boulders and cobble stones visible at low water about 2 feet above high water, 2 yards east of side of point, 3 yards northwest of side of point, 10 yards north-northeast of extreme end of point, and near three trees. Cement monument marking reference station is 9.32 meters N.  $7^{\circ} 09'$  E. of observed station.

*Marks.*—Observed station is a 2-inch square stick in center of a 4-inch tile pipe filled with and set in cement with top about flush with surface of ground. Reference station is center point of triangle on standard cement monument.

OUT.

*General locality.*—Eastern shore of northwestern branch of Smith Creek about one-eighth mile north of the main body of Smith Creek. (See chart No. 24.)

*Immediate locality.*—Observed station is on a sand and marsh point about 1 foot above high water, 6 yards north of shore, 7 yards southeast of shore, 24 yards east of extreme end of point, and 7 yards west of a cultivated field. Cement monument marking reference station is 6.96 meters N. 82° 50' E. of observed station.

*Marks.*—Observed station is center of a 2-inch pine stub set in cement. Reference station is center point of triangle on standard cement monument.

Chimney of house	226	33	..	½ mile.
"Flagpole" (on Jutland farmhouse)	310	56	40	¾ mile.

#### FLAGPOLE.

*General locality.*—Northeastern shore of northwestern branch of Smith Creek, on a house about three-fourths mile north-northwest of main body of Smith Creek. (See chart No. 24.)

*Immediate locality.*—Observed station is on east gable on the front of a house on Jutland farm.

*Marks.*—Observed station is flagpole on east gable on the front of residence on Jutland farm.

*References.*—None necessary.

#### RAN 2.

*General locality.*—Eastern shore of northwestern branch of Smith Creek on a point opposite a small cove and about seven-eighths mile north-northwest of main body of Smith Creek. (See chart No. 24.)

*Immediate locality.*—Observed station is on a narrow sand and marsh point about 1 foot above high water, 3 yards north of shore, 3 yards south of shore, 11 yards east of extreme end of point and in front of a bank 8 or 9 feet high covered with honeysuckle and several large trees. Cement monument marking reference station is about 10 feet above high water 13.74 meters N. 87° 50' E. of observed station.

*Marks.*—Observed station is hole in stub with top about 6 inches above surface of marsh. Reference station is center point of triangle on standard cement monument.

LABOR.

*General locality.*—Northeastern shore of Potomac River on western side of entrance to St. Marys River on a small island forming the southeastern end of St. George Island. (See chart No. 24.)

*Immediate locality.*—Observed station is on a marsh grass point about on level with high water, 5 yards north of side of point, 5 yards west of side of point, 8 yards northwest of extreme end of point, 65 yards southwest of another point, 65 yards north-northeast of still another point, and 125 yards southeast of a small pine woods across slough. Cement monument marking reference station is 13.56 meters N. 64° 06' W. of observed station.

*Marks.*—Observed station is nail in stub with top about flush with surface of ground. Reference station is center point of triangle on standard cement monument.

## LYNCH POINT 3 (VIRGINIA).

*General locality.*—Southwestern shore of Potomac River about three-eighths mile northwest of Lynch Point on northwestern side of entrance to Yeocomico River. (See progress map.)

*Immediate locality.*—Observed station is on sand beach near edge of grass about on level with high water, 50 yards southeast of edge of dense pine woods and a wire fence, 90 yards northwest of another dense pine woods, and northeast of a slough with about a dozen trees on opposite side. One reference tile set in cement is at edge of woods 55.68 meters on a continuation inshore of line from Point Lookout Light. Another reference tile set in cement is in woods 85.53 meters in same direction as the nearer reference station.

*Marks.*—Observed station is center one of four nails in top of a post 5 inches below surface of ground. Reference stations are tiles set in cement with tops about 2 inches above surface of ground.

## BETWEEN.

*General locality.*—Eastern shore of St. Marys River about 1¼ miles northwest of Kitts Point at entrance to river. (See chart No. 24.)

*Immediate locality.*—Observed station is in a pasture about 3 feet above high water, 5 yards northeast of edge of bank, 5 yards southeast of a rail fence, 12 yards southwest of shore of a creek, and 7 to 10 yards west to northwest of persimmon trees. Cement monument marking reference station is at edge of high land 14.42 meters S. 56° 22' E. of observed station.

*Marks.*—Observed station is nail in stub with top flush with surface of ground. Reference station is center point of triangle on standard cement monument.

## FORT.

*General locality.*—Eastern shore of St. Marys River on Fort Point about  $2\frac{1}{4}$  miles north of entrance to river and seven-eighths of a mile south of Priests Point. (See chart No. 24.)

*Immediate locality.*—Observed station is in a cultivated field about 15 feet above high water, 16 yards east of edge of bank, 70 yards west by south of a house, and 34 yards south-southwest of a corner of a fence. Cement monument marking reference station is 32.17 meters N.  $22^{\circ} 20'$  E. of observed station.

*Marks.*—Observed station is nail in stub with top flush with surface of ground. Reference station is center point of triangle on standard cement monument.

*References.*—

## POND.

*General locality.*—Western shore of St. Marys River on Pond Point about seven-eighths of a mile north-northeast of Cherryfield Point at entrance to St. George River. (See chart No. 24.)

*Immediate locality.*—Observed station is on marshland at edge of woods about on level with high water, 6 yards west of edge of marsh, 7 yards south of edge of marsh, 25 yards northeast of edge of marsh, and 20 to 30 yards north and east of pine trees. Cement monument marking reference station is 29.59 meters S.  $77^{\circ} 29'$  W. of observed station.

*Marks.*—Observed station is nail in stub. Reference station is center point of triangle on standard cement monument.

## ROD (PRIESTS HOUSE).

*General locality.*—Eastern shore of St. Marys River on Priests Point at south side of entrance to St. Inigoes Creek. (See chart No. 24.)

*Immediate locality.*—Observed station is on a small cupola-shaped centerpiece, or ventilator, on middle of roof of a summer residence of the order of Jesuits, sometimes called Priests Villa.

*Marks.*—Observed station is a lightning rod on the center ventilator on middle of roof of Priests Villa.

*References.*—None necessary.

## THOMPSON.

*General locality.*—Western shore of St. Marys River about three-eighths of a mile east-northeast of entrance to Carthagena Creek, five-eighths of a mile southwest of Windmill Point, and 1 mile north of Pond Point. (See chart No. 24.)

*Immediate locality.*—Observed station is in a cultivated field about 20 feet above high water, 5 yards southwest of edge of bank, 6 yards northeast of edge of bank, and 7 yards west of extreme edge of bank. Cement monument marking reference station is buried with top about 10 inches below surface of ground 25.00 meters N.  $36^{\circ} 53'$  W. of observed station.

*Marks.*—Observed station is center of a 3-inch square pine box with top flush with surface of ground. Reference station is center point of triangle on standard cement monument with top about 10 inches below surface of ground.

INIGOES.

*General locality.*—Northern side of entrance to St. Inigoes Creek about five-eighths of a mile north of Priests Point and five-eighths of a mile east of Windmill Point. (See chart No. 24.)

*Immediate locality.*—Observed station is offshore in about 4 feet of water, 1½ feet southeast of boat landing, and 45 yards southwest of shore. Cement monument marking reference station is on top of bank about 15 feet high, 50.87 meters N. 39° 25' E. of observed station.

*Marks.*—Observed station is a 3-inch square stub driven into bottom in about 4 feet of water and standing plumb with top about 2 feet above high water. Reference station is center point of triangle on standard cement monument.

*References.*—

ST. INIGOES CHURCH CROSS.

*General locality.*—Eastern side of St. Marys River inshore about 1 mile east from Priests Point and three-fourths of a mile south of Grason Wharf on St. Inigoes Creek. (See chart No. 24.)

*Immediate locality.*—Observed station is on St. Inigoes Catholic Church.

*Marks.*—Observed station is center of cross on St. Inigoes Catholic Church.

*References.*—None necessary.

CHURCH.

*General locality.*—Southeastern shore of St. Inigoes Creek about five-eighths mile east of St. Marys River and one-fourth mile southwest of Grason Wharf. (See chart No. 24.)

*Immediate locality.*—Observed station is about 2 feet above high water on a rounded point of land nearly surrounded by water, 13 yards southeast of shore, 14 yards south of shore, 24 yards west-southwest of shore, and 35 yards north of inlet and cedar trees.

*Marks.*—Observed station is center point of triangle on standard cement monument.

## SMOKE.

*General locality.*—Southeastern shore of St. Inigoes Creek about one-fourth mile east of Grason Wharf. (See chart No. 24.)

*Immediate locality.*—Observed station is on a tenant house which is about 15 feet above high water located about one-fourth mile east of Grason Wharf.

*Marks.*—Observed station is center of brick chimney on west end of house.

*References.*—None necessary.

## CHESTNUT.

*General locality.*—Southern shore of Upper St. Inigoes Creek about one-half mile east-northeast of Grason Wharf, near the entrance to an eastern branch of creek, and  $1\frac{1}{4}$  miles northeast of St. Marys River. (See chart No. 24.)

*Immediate locality.*—Observed station is in a cultivated field fringed by tall trees about 20 feet above high water, 18 yards south of edge of bank, 70 yards southwest of corner of field, 80 yards west-southwest of edge of bank, 95 yards northeast of trees at hollow, 110 yards southwest of a point, and 150 yards east by north of point where rail fence meets trees.

*Marks.*—Observed station is center point of triangle on standard cement monument with top about 12 inches below surface of ground. Surface mark is center of 3-inch square wooden box.

## BELLO.

*General locality.*—Western shore of St. Marys River on Portobello Point about five-eighths mile north-northwest of Chancellor Point and  $1\frac{1}{4}$  miles north of Windmill Point. (See chart No. 24.)

*Immediate locality.*—Observed station is on northeast peak of roof on wharf house at Portobello Landing.

*Marks.*—Observed station is a flagpole on northeast peak of wharf house.

*References.*—None necessary.

## WATER TOWER (PORTO BELLO).

*General locality.*—Western side of St. Marys River inshore about one-fourth mile west of Portobello Landing. (See chart No. 24.)

*Immediate locality.*—Observed station is on a detached structure with a water tank on top.

*Marks.*—Observed station is center of water tank.

*References.*—None necessary.

## GRAVEL.

*General locality.*—Eastern shore of St. Marys River about three-eighths mile north-northeast of Chancellor Point, and five-eighths mile east of Portobello Point. (See chart No. 24.)

*Immediate locality.*—Observed station is on gravel washed up between river and slough about on level with high water, 2 yards north of gravel and marsh line, 33 yards east-northeast of outlet of slough, and 65 yards southwest of point where woods and river meet. Cement monument marking reference station is 26.99 meters N.  $86^{\circ} 03'$  E. of observed station.

*Marks.*—Observed station is nail in stub. Reference station is center point of triangle on standard cement monument.

CALVERT MONUMENT.

*General locality.*—Eastern shore of St. Marys River on high prominent point near site of Old St. Marys. (See chart No. 24.)

*Immediate locality.*—Observed station is a tall granite shaft erected in memory of Calvert who founded the first settlement of Maryland near this point.

*Marks.*—Observed station is apex of pyramidal top of shaft of Calvert Monument.

*References.*—None necessary.

EPISCOPAL CHURCH CROSS (OLD ST. MARYS).

*General locality.*—Eastern shore of St. Marys River near site of Old St. Marys. (See chart No. 24.)

*Immediate locality.*—Observed station is on tower of the Episcopal Church at Old St. Marys.

*Marks.*—Observed station is center of cross on tower of the Episcopal Church.

*References.*—None necessary.

PAGAN.

*General locality.*—Western side of upper St. Marys River on Pagan Point opposite site of Old St. Marys. (See chart No. 24.)

*Immediate locality.*—Observed station is about 30 feet above high water, 120 yards southeast of river, 130 yards southwest of river, 26 yards southwest of a corn crib, 6 yards north of a wire fence, 16 yards south of another wire fence, and 19 yards west of still another wire fence.

*Marks.*—Observed station is center point of triangle on standard cement monument with top about 10 inches below surface of ground. Surface mark is nail in stub.

*References.*—

ST. GEORGE 4.

*General locality.*—Northeastern shore of Potomac River about one-eighth mile north of southern end of St. George Island and one-half mile west-southwest of entrance to Island Creek. (See chart No. 24.)

*Immediate locality.*—Observed station is on grassy sand about 3 feet above high water, 1 yard northeast of shore, 200 yards northwest by west of extreme end of point, and 150 yards southeast of another point. Standard cement monument marking reference station of 1909 is 26.41 meters N. 42° 16' E. of observed station. Reference station No. 1 (tile pipe set in cement) is 31.58 meters N. 14° 30' E. of observed station. Reference station No. 2 (tile pipe set in cement) is 48.98 meters N. 59° 27' E. of observed station.

*Marks.*—Observed station is ¼-inch iron pipe in 3-inch tile pipe set in cement with top about 12 inches below surface of ground. Surface mark is nail in stub. Reference station of 1909 is center point of triangle on standard cement monument. Reference station No. 1 is center of 3-inch tile pipe set in cement with top 3 inches above surface of ground. Reference station No. 2 is center of a 3-inch tile pipe set in cement with top about flush with surface of ground.

## HERON.

*General locality.*—Northern side of Potomac River on a sand bar called Heron Island at entrances to St. Clement Bay and Bretons Bay and about 1 $\frac{1}{2}$  miles east-northeast of Blakistone Island Light. (See chart No. 25.)

*Immediate locality.*—Observed station is on southeastern end of sand bar remains of Heron Island.

*Marks.*—Observed station is awash except at low water and was not marked.

*References.*—None necessary.

## BLAKISTONE ISLAND LIGHT.

*General locality.*—Northern side of Potomac River on southern end of Blakistone Island off entrance to St. Clement Bay and Bretons Bay. (See chart No. 25.)

*Immediate locality.*—Observed station is on a dwelling near a fog-bell tower.

*Marks.*—Observed station is center point of lantern on a dwelling known as Blakistone Island Light-house.

*References.*—

## ROOF.

*General locality.*—Eastern side of St. Clement Bay about one-half mile north-northeast of entrance to bay, and three-eighths mile east-southeast of extreme end of Long Point. (See chart No. 25.)

*Immediate locality.*—Observed station is on western peak of roof of a barn behind a large house.

*Marks.*—Observed station is a 3-inch square staff fastened and braced to the western peak of roof of barn.

*References.*—None necessary.

## CANOE.

*General locality.*—Western shore of lower St. Clement Bay opposite Long Point and about 2 miles north of Blakistone Island. (See chart No. 25.)

*Immediate locality.*—Observed station is in a cultivated field about 10 feet above high water, 4 yards northwest of edge of bank, 4 yards southwest of a ditch and trees in hollow, and 60 yards south by east of a large apple tree. Cement monument marking reference station is 53.28 meters N.  $17^{\circ}$   $17'$  W. of observed station.

*Marks.*—Observed station is nail in stub with top about 2 inches above surface of ground. Reference station is center point of triangle on standard cement monument.

## EEDLING.

*General locality.*—Western shore of Wicomico River about 1¼ miles southwest of Mills Point and about 1 mile southeast of mouth of Bowmans Creek. (See chart No. 26.)

*Immediate locality.*—Observed station is in a shell-covered cultivated field, about 10 feet above high-water mark, 37 yards southwest of shell and gravel beach, 88 yards west-northwest of extreme end of point, and 79 yards north of a ditch in marsh. Cement monument marking reference station is 23.99 meters N. 89° 56' W. of observed station.

*Marks.*—Observed and reference stations are marked by the center point of the triangles on standard cement monuments.

## SACRED HEART CHURCH SPIRE (BUSHWOOD).

*General locality.*—Easterly side of Wicomico River on high land about  $1\frac{1}{2}$  miles inland, north by east of Bushwood Wharf. (See chart No. 26.)

*Immediate locality.*—Observed station is steeple of Sacred Heart Church near Bushwood.

*Marks.*—Observed station is center of cross on steeple.

*References.*—None necessary.

## HEDNEY.

*General locality.*—Western shore of Wicomico River on first point above mouth of Charleston Creek and about  $1\frac{3}{4}$  miles northwest of White Point. (See chart No. 26.)

*Immediate locality.*—Observed station is about 25 feet above high-water mark, 16 yards west-southwest of edge of bank, 139 yards north of large tree at edge of bank, 85 yards north of oak tree at edge of bank, 155 yards east-northeast of gum tree 20 inches diameter on bank of a pond, and about  $\frac{1}{8}$  mile east-southeast of a house among trees.

*Marks.*—Observed station is center point of triangle on standard cement monument with top buried 12 inches below the surface of the ground. Surface mark is nail in stub with top 5 inches above surface of ground.

## ROCK POINT CATHOLIC CHURCH CROSS.

*General locality.*—Eastern shore of Wicomico River at Rock Point. (See chart No. 26.)

*Immediate locality.*—Observed station is in settlement called Rock Point. It is on the larger of two similar buildings, the smaller one being the schoolhouse.

*Marks.*—Observed station is center point of cross on Rock Point Catholic Church.

*References.*—None necessary.

## PREC.

*General locality.*—Eastern shore of Wicomico River on Bluff Point about 2 miles north-northeast of Cobb Point Bar Light. (See chart No. 26.)

*Immediate locality.*—Observed station is about 10 feet above high-water mark, 34 yards southeast of nearest end of neck of Bluff Point, 29 yards south-southeast of shore, 16 yards northeast of shore, and 88 yards west by southwest of house.

*Marks.*—Observed station is center point of triangle on standard cement monument.

## ST. MARGARET 2.

*General locality.*—Northwestern side of Potomac River on the southwestern side of St. Margarets Island in the mouth of the Wicomico River about 1 mile northeast of Cobb Point Bar Light. (See chart No. 26.)

*Immediate locality.*—Observed station is on a bluff about 12 feet above high-water mark, 15 inches northeast of edge of bluff, 86 yards northwest of cow shed, 129 yards south-southwest of several houses, and 154 yards west-southwest of Bailey (large) house. Cement monument marking reference station is 79.19 meters N. 46° 26' E. of observed station and at corner of cow shed.

*Marks.*—Observed station is center of a stub in a 2¼-inch tile pipe set in cement with top flush with ground. Reference station is center point of triangle of standard cement monument.

## BOUNDARIES OF OYSTER BARS.

### EXPLANATION.

The law of the United States authorizing the cooperation of the Department of Commerce and Labor in the survey of natural oyster beds of Maryland provides for the designation and employment by the Department of Commerce and Labor of such officers, experts, and other technically qualified persons "as may be necessary to cooperate with the Maryland State Board of Shell Fish Commissioners in making a survey of and locating the natural oyster beds, bars, and rocks in the waters within the State of Maryland." The oyster laws of Maryland provide that the Maryland Shell Fish Commissioners, with the aid of such persons as may be designated by the Government, shall proceed "to have laid out, surveyed, and designated on the said charts the natural beds and bars, and shall cause to be marked and defined as accurately as practicable the limits and boundaries of the natural beds, bars, and rocks as established by said survey, and they shall take true and accurate notes of said survey in writing, and make an accurate report of said survey, setting forth such a description of landmarks as may be necessary to enable the said board, or their successors, to find and ascertain the boundary lines of the said natural oyster beds, bars, and rocks, as shown by a delineation on the maps and charts." The oyster laws of Maryland also provide in another section that there shall "be made a true and accurate survey of the natural oyster beds, bars, and rocks \* \* \* with reference to fixed and permanent objects on the shore, giving courses and distances, to be fully described and set out in a written report of said survey."

Under the provisions of the laws quoted above the State of Maryland, in cooperation with the Department of Commerce and Labor, must define the boundaries of the natural oyster bars "as accurately as practicable" and also "with reference to fixed and permanent objects on the shore, giving courses and distances." The requirement of "as accurately as practicable" is easily fulfilled by definition of the location of the corners of the oyster bars by latitude and longitude. In fact, this method is probably the most satisfactory and accurate one that could be used for all purposes of legal definition or for relocation of the oyster-bar boundaries by competent engineers. Therefore the additional requirement of "giving courses and distances" is superfluous and is only fulfilled in the published definitions on account of the specific provisions of the law making it compulsory. This part of the description of boundaries has involved an immense amount of extra computations in order to prevent technical discrepancies between the latitude and longitude of a corner of an oyster bar and its distance and bearing from objects on shore of known latitude and longitude without adding anything to the accuracy and very little to the convenience in the practical use of the descriptions of the oyster-bar boundaries.

As provided by law, the boundaries of the oyster bars are all straight lines, but in the work already completed they have inclosed areas of all shapes from triangles to

complicated 14-sided figures and of all sizes from 4 acres to 7,548 acres. The sides have varied in length from 93 to 7,529 yards, and in some cases the corners of the boundaries have been practically at the triangulation stations from which they are located, while in other instances they were over 13,600 yards from the landmarks most available for the purpose of fixing their position.

The varied characteristics of the legal boundaries of the oyster bars indicated by the above statement, together with the complicated requirements of the law under which the survey has been made and the magnitude of the work, with the consequent need of fixed and uniform methods, have made the problem of describing the boundaries one of considerable difficulty and great importance.

The boundaries of the oyster bars of Maryland, as established by the shell fish commission and delineated on the Coast and Geodetic Survey charts and projections and on the leasing charts of the commission, are technically defined and described by a method somewhat different from that used in other oyster surveys. But it is believed that the forms finally adopted will fulfill all needs of the survey for both the present and the future.

#### METHOD OF DESCRIBING BOUNDARIES.

The descriptions have been arranged in tabular form, thus avoiding many hundred repetitions of the same words by making one explanation of the tables sufficient for all oyster bars in each county.

*Title.*—At the top of each tabular form is given the legal name of the oyster bar to be described and the one by which it is known and designated in the published oyster records and on the oyster charts. The adopted name of the oyster bar is the one used locally, as nearly as could be ascertained by the hydrographic engineer of the commission; and when there was no local name in common use a name was selected from one of the prominent features of the vicinity that would naturally suggest the section of the waters where the oyster bar was located.

Underneath the name in parentheses is given the general locality of the oyster bar and the serial number of the Maryland Oyster Chart on which its legal boundaries are shown.<sup>1</sup>

*First column.*—This column, under the heading of "Corner of bar," gives the number corresponding to the corner of the boundary as shown on the charts and to the number on the buoy marking the actual corner of the bar. The numbers of the corners have been assigned by naming the southernmost point No. 1, thence proceeding in a clockwise direction around the bar. Where the corner of one oyster bar is identical with the corner of the boundaries of one or more other oyster bars, only the number of the corner of the oyster bar being described in the table is given in this column.

*Second and third columns.*—These two columns, under the headings of "Latitude" and "Longitude," give the geographic positions of the corners. These positions have been adopted by the commission as the primary technical definition of the location of the corners, and should be considered as final in case of a dispute arising from discrepancies caused by other means of location. The latitudes and longitudes given in these columns are based on the United States standard datum of the Coast and Geodetic

<sup>1</sup> These charts can be obtained by application to the Superintendent of the Coast and Geodetic Survey at Washington, D. C.

Survey, and the points thus defined can be relocated from distant triangulation stations of the survey, even though all the landmarks and buoys originally used for their location have been destroyed by natural or other causes.

*Fourth and fifth columns.*—These two columns, under the general heading of "True bearing"<sup>1</sup> and the specific headings "Forward" and "Back," give bearings measured from a true north-and-south line. The three "Forward" bearings are from the corner of the boundary designated in the first column to the triangulation stations named on the corresponding lines in the last column, and the three "Back" bearings are from these same stations in the last column to the corresponding corner of boundary in the first column. The difference in minutes of arc between the forward and back bearings shown in some cases is actual and not accidental, and is due to the fact that the computations took into account the spheroidal shape of the earth.

*Sixth column.*—This column, under the heading of "Distance," gives the three computed distances in yards from the corner of the bar noted in the first column to the three triangulation stations named on the corresponding lines in the last column, and vice versa.

*Seventh column.*—This column, under the heading of "U. S. C. & G. S. triangulation station,"<sup>2</sup> gives the names of the landmarks from which were computed the corresponding "Latitude," "Longitude," "True bearing," and "Distance" of the "Corner of the bar" designated in the first column. A full description of the location and markings of these triangulation stations is given in another part of this publication under the heading of "Descriptions of triangulation stations."

#### SURVEYING METHODS FOR RELOCATION OF BOUNDARIES.

There are a number of methods that can be used in the relocation of the actual boundaries of the natural oyster bars as technically described in this publication and delineated on the published charts of the Coast and Geodetic Survey and the leasing charts of the shellfish commission.

The following brief descriptions of five of these more or less different methods assume a certain amount of experience and knowledge on the part of the engineer in the particular kind of surveying under consideration, and are only intended as reminders of ways and means that can be used.

There are two problems that are likely to present themselves to those interested in the boundaries of natural oyster bars—one, to determine whether the buoys marking the corners have been dragged or otherwise moved from their correct positions, and the other, to relocate or reestablish a buoy at the point from which it was removed. The different ways of solving these two problems partly depend upon the instruments possessed by the engineer and his assistants and partly on his training and experience.

(1) *Triangulation.*—This method is the one that will give the greatest accuracy, but on account of its requiring special data and instruments, and being an operation rarely used by engineers not engaged in geodetic surveying, it is recommended only for cases in dispute that can not be settled satisfactorily by some other method. An

<sup>1</sup> The mean magnetic variation for St. Marys County was  $5^{\circ} 25'$  west of north in 1910 and increasing at the rate of  $4'$  yearly.

<sup>2</sup> Geographic positions of these triangulation stations can be obtained by application to the Superintendent of the Coast and Geodetic Survey, Washington, D. C.

explanation of this class of work would be too long for a report of this sort, and those not familiar with this method are referred to the publications on the subject by the Coast and Geodetic Survey.

(2) *Hydrographic*.—This method is the most simple and satisfactory one that can be adopted if the surveyor can obtain the use of the necessary instruments and assistants. It is the one best suited for the work of the engineers of the commission in relocating corners of boundaries, as it gives results of the accuracy ordinarily required and is rapid in execution. Besides, it has the advantage of being available whenever three triangulation stations of suitable relative positions are visible from the offshore points needing relocation.

Most navigators and others familiar with the use of a sextant are well acquainted with the graphic three-point method of fixing a position on water, and only a brief description of the operation will be stated.

In the case where there is only one engineer having a single sextant the three-point method can be used if the two angles determining the position of a buoy are first derived from the "Forward" bearings given in the tabular forms describing the boundaries of the oyster bars. For example, take "Brooks Shallows" oyster bar, which is the first one described in this publication, and assume that "Corner No. 3" is to be examined as to its position. The angle between the two landmarks "Dwarf" and "Hallowing" as determined from right to left from the forward bearings from this corner is  $54^{\circ} 50'$  and the angle between "Hallowing" and "Indian" is  $77^{\circ} 10'$ . Having these two angles, the engineer proceeds to the buoy of doubtful location and measures the actual sextant angles between the landmarks for which the calculations were made. If the measured and calculated angles do not agree the buoy is not in its correct position and the boundary corner must be relocated. This is accomplished by moving the boat about until a point is reached where the angles do agree, and this point being the desired location, the buoy can be placed in its correct position.

If the engineer can obtain the use of both a sextant and a three-arm protractor ("position finder"), the availability of the hydrographic method is increased, as the use of the protractor is essential in case of the washing away or destruction of one or more of the landmarks originally used in describing the boundaries. Under these circumstances, any three landmarks of suitable relative position that are visible from the point to be located can be utilized. For example, the engineer can proceed to the buoy of doubtful position and measure the two adjacent sextant angles between the three landmarks selected. These two angles are set off on the three-arm protractor and the actual position of the buoy plotted on the chart by shifting the protractor about until the edge of each of the three arms passes through the center of the symbols on the chart marking the position of the three landmarks selected. The center of the hub of the protractor will indicate on the chart the actual position of the buoy, and if the point thus obtained does not coincide with the true position of the corner of the boundary as given on the chart the surveyor can proceed to locate the buoy correctly by reversing the operation. This is done by placing the center point of the hub of the protractor over the corner of the boundary in question and measuring on the chart the two adjacent protractor angles between the three selected landmarks. One of the angles thus obtained is set on the sextant and the boat moved about until the two landmarks are shown by the

sextant to subtend the same angle obtained from the protractor. The second angle is then placed on the sextant and the same operation gone through, and so on, first using one angle on the sextant then the other until a point is reached where both observed sextant angles are practically identical with the protractor angles. The point thus located is the desired one and the buoy can be placed to mark the true position of the corner of the boundary in question.

If the engineer possesses two sextants and a protractor, this problem is far easier of solution, as the two angles can be set off on separate sextants and the observer can quickly find the desired point where they agree with the protractor angles by using one sextant after the other without the need of resetting either.

If there are two observers, two sextants, and a protractor, it can be seen that the best conditions for both rapid and accurate hydrographic location of a point is attained. In fact, this is the method by which the buoys at the corners of the boundaries were originally placed by the hydrographic engineer to the commission.

(3) *Magnetic bearings from offshore.*—This method of fixing a position on water is a simple and well-known one in navigation. It is available to anyone having a boat compass and will be of special use to the State fishery force in investigating cases where buoys are supposed to have been moved for illegal purposes.

In the case where a buoy is supposed to have been moved from its true position the observer can take compass bearings to the three landmarks given in the last column of the tables opposite the boundary corner in question. These bearings are then corrected for the local declination,<sup>1</sup> and if the results agree with the published bearings the buoy is correctly located.

In the case where the buoy is not in its correct position, or has disappeared altogether, the desired point can be determined by maneuvering the vessel until the corrected bearings agree with the ones in the tabular descriptions, when the buoy can be anchored in its proper location.

In the case where the landmarks for which the bearings are published have been destroyed or washed away any landmarks whose positions are indicated on the charts can be used. This can be done by getting their bearings directly from the chart by parallel rulers or a protractor and then applying these new bearings in the same manner as the ones published in the tables.

(4) *Magnetic bearings from shore.*—This method will be of special value to engineers having an ordinary surveyor's compass. The compass can be set over the point marking a "triangulation station" on shore, the name of which is given in the last column opposite the "corner" in question. The instrument is then set at the corresponding "back" bearing (corrected for local magnetic declination) given in the fifth column of the tables opposite the "corner" in question. The direction thus determined will give one range on which the desired point must be located. The compass can then be moved to a second triangulation station and another range located in a similar manner. The intersection of these two range lines will give the desired point, but in general it should be checked by an additional range line determined from a third station.

(5) *Horizontal angles measured at landmarks.*—This process is a modification of the triangulation method, and will be useful to engineers who have a transit and desire considerable accuracy.

<sup>1</sup> The mean magnetic variation for St. Marys County is  $5^{\circ} 25'$  west of north in 1910 and increasing at the rate of  $4'$  yearly.

The instrument is placed over a "triangulation station," the name of which appears in the last column of the tabular description opposite the "corner" in question. The telescope is then pointed to the landmark indicated in the "Descriptions of landmarks" as having a direction of  $0^{\circ} 00' 00''$  from the triangulation station being occupied by the transit. The tabular description of the boundaries is next examined and the "back" bearing of the questionable boundary "corner" from the landmark being occupied is taken out. The angle calculated from this "back" bearing and the bearing given in parentheses alongside the zero landmark in the "Descriptions of landmarks" is then set off on the transit and a range line established on which the desired point must be located. A similar process is then carried on at a second station, and so on until the position of the buoy is satisfactorily fixed.

## APPENDIXES.

### APPENDIX A.—LAWS RELATING TO THE COOPERATION OF THE COAST AND GEODETIC SURVEY AND BUREAU OF FISHERIES WITH THE MARYLAND SHELL FISH COMMISSION.

The work of the Coast and Geodetic Survey and of the Bureau of Fisheries, in cooperation with the Maryland Shell Fish Commission, in surveying the oyster bars, establishing permanent landmarks at triangulation stations, and preparing for publication the necessary charts and technical and legal descriptions of boundaries and landmarks shown on these charts, has been executed in compliance with a request from the governor of the State of Maryland to the Secretary of Commerce and Labor, and by the authority of the following laws of the United States and Maryland:

[Act of Congress approved May 26, 1906.]

AN ACT To authorize the Secretary of Commerce and Labor to cooperate, through the Bureau of the Coast and Geodetic Survey and the Bureau of Fisheries, with the shellfish commissioners of the State of Maryland in making surveys of the natural oyster beds, bars, and rocks in the waters within the State of Maryland.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the Secretary of Commerce and Labor be, and he is hereby, authorized and directed, upon the request of the governor of the State of Maryland, to designate such officers, experts, and employees of the Bureau of the Coast and Geodetic Survey and of the Bureau of Fisheries as may be necessary to cooperate with the Maryland State board of shellfish commissioners in making a survey of and locating the natural oyster beds, bars, and rocks in the waters within the State of Maryland; and the Secretary of Commerce and Labor is hereby authorized and directed to furnish to the officers, experts, and employees of said Bureaus so detailed as aforesaid such instruments, appliances, and steam launches as may be necessary to make the survey aforesaid; and the Secretary of Commerce and Labor is hereby authorized to have made in the Bureau of the Coast and Geodetic Survey all the plats necessary to show the results of the aforesaid survey and the locations of the said natural oyster beds, bars, and rocks in the waters within the State of Maryland, and to furnish to the board of shellfish commissioners of the State of Maryland such copies as may be necessary, and for this purpose to employ, in the District of Columbia and elsewhere, such technically qualified persons as may be necessary to carry out the purpose of this act.

SEC. 2. That the Secretary of Commerce and Labor is hereby further authorized to have erected or constructed by the officers so detailed as aforesaid, while making such survey, such structures as may be necessary to mark the points of triangulation, so that the same may be used for such future work of the Coast and Geodetic Survey as the said Bureau may be hereafter required to perform in prosecuting the Government coast survey of the navigable waters of the United States located within the State of Maryland.

\* \* \* \* \*  
SEC. 4. That this act shall take effect from the date of its passage.

[Act of Congress approved June 30, 1906.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and seven, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and seven, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including the expenditures authorized under Public Act Numbered One hundred and eighty-one, approved May twenty-sixth, nineteen hundred and six, and contingent expenses incident thereto, five thousand dollars, together with the unexpended balance under this appropriation for nineteen hundred and six and prior years which is hereby reappropriated and made available on this account for the fiscal year nineteen hundred and seven. \* \* \*

---

[Act of Congress approved March 4, 1907.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and eight, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and eight, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, to be immediately available and to continue available until expended, twenty-five thousand dollars. \* \* \*

---

[Act of Congress approved May 27, 1908.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and nine, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and nine, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, which expenses, including cost of plats and charts, shall not exceed fifteen thousand dollars in any one year, to be immediately available, twenty thousand dollars.

---

[Act of Congress approved March 4, 1909.]

AN ACT Making appropriation for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and ten, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and ten, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, which expenses, including cost of plats and charts, shall not exceed fifteen thousand dollars in any one year, to be immediately available, twenty thousand dollars.

---

[Act of Congress approved June 25, 1910.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and eleven, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and eleven, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, to be immediately available fifteen thousand dollars.

[Act of Congress approved March 4, 1911.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and twelve, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects herein-after expressed, for the fiscal year ending June thirtieth, nineteen hundred and twelve, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, to be immediately available, thirteen thousand dollars. \* \* \*

[Act of the Legislature of Maryland approved April 2, 1906.]

AN ACT To establish and promote the industry of oyster culture in Maryland, to define and mark natural oyster beds, bars, and rocks lying under the waters of this State, to prescribe penalties for the infringement of the provisions of this Act, and \* \* \*.

SECTION 1. *Be it enacted by the General Assembly of Maryland,* That the following sections be, and they are hereby, added to article 72 of the Code of Public General Laws, title "Oysters." \* \* \*

SEC. 86. The Board of Shell Fish Commissioners shall, as soon as practicable after the passage of this Act, cause to be made a true and accurate survey of the natural oyster beds, bars and rocks of this State, said survey to be made with reference to fixed and permanent objects on the shore, giving courses and distances, to be fully described and set out in a written report of said survey, as hereinafter required. A true and accurate delineation of the same shall be made on copies of published maps and charts of the United States coast and geodetic survey, which said copies shall be filed in the office of the said commissioners in the city of Annapolis, and the said commissioners shall further cause to be delineated upon copies of the published maps and charts of the United States coast and geodetic survey, of the largest scale, one copy for each of the counties of this State in the waters of which there are natural oyster beds, bars and rocks, all natural beds, bars and rocks lying within the waters of such county, which maps shall be filed in the offices of the clerks of the Circuit Court for the respective counties wherein the grounds so designated may lie. \* \* \*

SEC. 87. The Governor of this State is hereby requested to ask the assistance of the United States coast and geodetic survey, and of the United States Fish Commissioner, to aid in the carrying out of the provisions of the preceding section.

\* \* \* \* \*

SEC. 89. As soon as practicable after the first day of April, 1906, the said commissioners shall organize, and shall at once proceed, with the assistance of such person or persons as may be detailed by the United States coast and geodetic survey and the United States Fish Commissioner, to aid them in their work, and of such persons as may be appointed under the preceding section, to have laid out, surveyed and designated on the said charts, the natural beds and bars, and shall cause to be marked and defined as accurately as practicable the limits and boundaries of the natural beds, bars, and rocks as established by said survey, and they shall take true and accurate notes of said survey in writing, and make an accurate report of said survey, setting forth such a description of landmarks as may be necessary to enable the said board, or their successors, to find and ascertain the boundary lines of the said natural oyster beds, bars and rocks, as shown by a delineation on the maps and charts provided in this Act; said report shall be completed and filed in the office of the board in the city of Annapolis within ninety days after the completion of the survey of any county. Said commissioners shall cause the same to be published in pamphlet form, and transmit copies of the said to the Clerks of the Circuit court for the respective counties, where the charts have been filed or directed to be filed as hereinafter provided; the said report to be filed by the clerks of the several counties in a book kept for that purpose. And the said survey and report, when filed, subject to the right of appeal hereafter provided for in this Act, shall be taken in all of the courts of this State as conclusive evidence of the boundaries and limits of all natural oyster beds, bars and rocks, lying within the waters of the county wherein such survey and report are filed, and shall be construed to mean in all of the said courts that there are no natural oyster beds, bars or rocks lying within the waters of the counties wherein such report and survey are filed other than those embraced in the survey authorized by this Act, and that all areas of the Chesapeake Bay and its tributaries within the State of Maryland, not shown in the survey to be natural oyster beds, bars or rocks shall be construed in all the courts of the State to be barren bottoms and

open for disposal by the State for the purpose of private planting or propagation of oysters thereon under the provisions of this Act; provided, that the said survey and report shall not be construed as to affect in any manner the holdings by citizens of this State in any lot which may have been appropriated or taken up under the laws of this State prior to the approval of this Act.

The law of the State of Maryland, passed March 9, 1842, authorizing officers of the United States Coast and Geodetic Survey to enter upon the lands within the State limits for the purposes of the survey, is as follows:

AN ACT Concerning the Survey of the Coast of Maryland.

SECTION 1. *Be it enacted by the General Assembly of Maryland*, That it shall and may be lawful for any person or persons employed under and by virtue of an act of the Congress of the United States, \* \* \* at any time hereafter to enter upon lands within this State for the purpose of exploring, surveying, triangulating, or leveling, or doing any other matter or thing which may be necessary to effect the objects of said act, and to erect any works, stations, buildings, or appendages requisite for that purpose, doing no unnecessary injury to private or other property.

SEC. 2.<sup>1</sup> *And be it enacted*, That in case the person or persons employed under the act of Congress aforesaid, can not agree with the owners or possessors of the land so entered upon and used as to the amount of damage done thereto by reason of the removal of fences, cutting of trees or injury to the crop or crops growing on the same, it shall and may be lawful for the said parties or either of them to apply to the chief justice for the time being or one of the associate judges of the judicial district in which such land may be situated, who shall thereupon appoint three disinterested and judicious freeholders, residents of the same judicial district, to proceed with as much despatch as possible to the examination of the matter in question, and the faithful assessment of the damages sustained by the owners or possessors aforesaid, and the said freeholders or a majority of them, having first taken and subscribed an oath or affirmation before the chief or associate justice aforesaid or other person duly authorized to administer the same, that they will well and truly examine and assess as aforesaid, and having given five days' notice to both parties of the time of their meeting, shall proceed to the spot, and then and there upon their own view and if required, upon the evidence of witnesses (to be by them sworn or affirmed and examined), shall assess the said damages, and shall afterward make report thereof and of their proceedings in writing under their hands and seals and file the same within five days thereafter in the office of the clerk of the county in which the land aforesaid is situated, subject to an appeal by either party to the county court of the said county within ten days after filing as aforesaid, and the said report so made as aforesaid if no appeal as aforesaid be taken, shall be held to be final and conclusive as between the said parties, and the amount so assessed and reported shall be paid to the said owners or possessors of the land so damaged within twenty days after the filing of said report, and the said chief or associate justice as aforesaid, shall have authority to tax and allow upon the filing of said report, such costs, fees and expenses to the said freeholders for the performance of their duty as he shall think equitable and just, which allowance shall be paid by the person or persons employed under the act of congress aforesaid, within the time last above limited, but if an appeal as aforesaid be taken, the case shall be set down for hearing at the first term of county court aforesaid, ensuing upon and after appeal, and it shall be lawful for either party immediately after the entry of such appeal, to take out summons for such witnesses as may be necessary to be examined upon the hearing aforesaid, and the said court shall have power in its discretion to award costs against which ever the final judgment shall be entered, and such appeal at the option of either party may and shall be heard before and the damage assessed by a jury of twelve men to be taken from the regular panel and elected as in other cases.

SEC. 3. *And be it enacted*, That if any person or persons shall wilfully injure or deface or remove any signal, monument or building or any appendage thereto, erected, used or constructed under and by virtue of the act of congress aforesaid, such person or persons so offending shall severally forfeit and pay the sum of fifty dollars with costs of suit to be sued for and recovered by any person who shall first prosecute the same before any justice of the peace of the county where the person so offending may reside, and shall also be liable to pay the amount of damages thereby sustained, to be recovered with costs of suit in an action on the case, in the name and for the use of the United States of America, in any court of competent jurisdiction.

<sup>1</sup> Under the rulings of the Comptroller of the Treasury no damages can be collected except through the United States Court of Claims unless an agreement has been made in advance.

## APPENDIX B.—THE HAMAN OYSTER CULTURE LAW.

[Extract from Second Report of Shell Fish Commission.]

## OBJECT.

"The legislature in placing chapter 711 of the acts of 1906, better known as the Haman Oyster Culture Law, upon the statute books of Maryland, had a twofold object in view:

1. To encourage an industry in oyster culture upon the *barren bottoms* beneath the tidewaters of the State.
2. To prevent the leasing of *natural oyster bars* for the purpose of oyster culture."

## SURVEY.

"To make the leasing of barren bottoms possible and the leasing of natural bars impossible, provision was made for a survey of the natural bars for the purpose of accurately locating and marking the same. It was definitely provided that no barren bottoms should be leased in any part of the State until the natural bars of that region had been surveyed, chartered, and marked with buoys."

## DEFINITION OF A NATURAL OYSTER BAR.

## NATURAL BAR NOT DEFINED.

"The Shell Fish Commission is instructed by section 90 of the Haman Oyster Culture Law to exercise its judgment liberally in favor of the natural bars when surveying, charting and buoying them, but other than this the Commission is uninstructed in this important matter. The responsibility of defining a natural bar is placed upon the commission."

## DIVERSITY OF OPINION.

"No definition of a natural oyster bar could be formulated by any man or body of men which would meet with the approval of all parties concerned. Oystermen, as a rule, hold that all bottoms where oysters grow or have grown naturally even though now practically barren of oysters should be considered natural bars. Other citizens of the State who are not directly interested in the oyster business, but interested in the oyster industry from the standpoint of revenue, hold, as a rule, that no bottoms should be excluded from leasing for oyster culture which, by methods known to oyster culturists, may be made to yield a greater number of oysters than they now produce."

"It should be evident to every one that neither of these definitions could be adopted by the Commission as a working basis for determining which of the grounds surveyed are natural oyster bars."

## THE GOLDSBOROUGH DEFINITION.

The definition of a natural oyster bar which very nearly approaches a reasonable and satisfactory compromise between the views of the subject held by *oystermen* on one hand and by *oyster culturists* on the other is that contained in an opinion rendered by Judge Charles F. Goldsborough in the circuit court for Dorchester County in the July term, 1881, in the case of William T. Windsor and George R. Todd v. Job T. Moore.

This definition has been adopted by the Shell Fish Commission as the basis for the determination of the status of the various oyster bottoms surveyed and is as follows:

What then is a natural bar or bed of oysters? It would be a palpable absurdity for the State to attempt to promote the propagation and growth of oysters and to encourage its citizens, by a grant of land, to engage in their culture, if the lands authorized to be taken up were only those upon which oysters do not and can not be made to grow. That there may be lands covered by water in the State where no oysters can be found, but where, if planted, they could be cultivated successfully, may be possible, but, if so, I imagine that their extent must be too limited for them to be of much practical, general advantage for the purposes of such a law as the one under discussion; but there are thousands of acres of hard and shifting sands where oysters not only are not found, but where it would be folly to plant them, and these latter it can not be supposed that the State intended to offer to give away, for the simple reason that the State could not help knowing that nobody would have them.

Upon the other hand there are large and numerous tracts where oysters of natural growth may be found in moderate numbers, but not in quantities sufficient to make it profitable to catch them,

and yet where oysters may be successfully planted and propagated. In my opinion these can not be called natural bars or beds of oysters, within the meaning of the Act of Assembly, and it is just such lands as these that the State meant to allow to be taken up under the provisions of the above-mentioned section of the Act.

But there is still another class of lands where oysters grow naturally and in large quantities and to which the public are now and have been for many years in the habit of resorting with a view to earning a livelihood by catching this natural growth, and here, I think, is the true test of the whole question. Land can not be said to be a natural oyster bar or bed merely because oysters are scattered here and there upon it, and because if planted they will readily live and thrive there; but whenever the natural growth is so thick and abundant that the public resort to it for a livelihood, it is a natural oyster bar or bed and comes within the above-quoted restriction in the law, and can not be located or appropriated by any individual.

#### APPLICATION OF DEFINITION.

Before this definition may be of use in determining, accurately and scientifically, the status of an oyster ground, its central idea, "livelihood," must be expanded into accurately determinable factors, and these factors must be combined into a practical scheme of investigating the condition of the ground under consideration.

Stated briefly, a *livelihood* is represented by a *sum of money* obtained from the sale, at a fixed *price*, of a certain *quantity of oysters* gathered in a given time from an allotted *area of ground*.

Knowing the value of each of these factors, it becomes possible to calculate the number of oysters an oyster ground must produce per square yard in order that oystermen may secure a livelihood by working upon it.

NOTE.—The factors into which the Commission resolved the livelihood problem, the values assigned to each factor, and the scheme devised for practical use in examining and applying the definition to oyster bottoms are given in outline in their second report under the heading of the preceding extract, and in detail in their first report on pages 32 to 69.

#### APPENDIX C.—SUMMARY OF THE PARTICULAR SURVEYING OPERATIONS WHICH CONSTITUTE AN "OYSTER SURVEY" AS NOW BEING CARRIED ON IN MARYLAND.

*Explanation.*—A brief account of the particular surveying operations which constitute an "oyster survey" as now being carried on in Maryland will assist in the interpretation of records contained in the technical part of this report, and will be of interest to many who may not understand the necessity for the great amount of work being done or its complicated character.

To those familiar with methods used in surveying and charting the characteristic features of large bodies of water there is an evident necessity for the various operations performed, especially when it is known that the boundaries of the public oyster bars and of the private lots leased for purposes of oyster culture must be surveyed and charted with the greatest practical accuracy. To others it will be sufficient to state that the actual experience gained from oyster surveys in other States has proven that in order to avoid endless dissatisfaction and litigation it is necessary to accurately locate and permanently establish oyster boundaries as is now being done in Maryland.

*Triangulation survey.*—Such refinement of survey work as that demanded by the conditions of an oyster survey when carried on at considerable distances offshore can only be obtained by the use of a system of triangulation as a framework or foundation. Therefore, a triangulation survey including the permanent marking of the positions of landmarks with monuments and a record of the descriptions of their locations for future recovery is a necessary operation of a complete oyster survey.

*Topographic survey.*—The technical records which establish the relation between the offshore oyster boundaries and triangulation landmarks are sufficient for the requirements of engineers in making surveys, but do not supply the needs of others who are interested in the same boundaries by reason of their occupation as oystermen concerned as to the public oyster bars, or oyster culturists concerned as to the leasable bottoms. For these it is necessary to have the charts of the survey show the relation of the shore line and other topographic features to the boundaries of the public oyster bars and private oyster farms. Therefore, a topographic survey is a necessary operation of a complete oyster survey.

*Hydrographic survey.*—In the settlement of the important question of what is, or what is not, a natural oyster bar, and in the consideration of bottoms to be selected for purposes of oyster culture,

information as to the depth of water and the character of the bottom is required. Therefore, a hydrographic survey is a necessary operation of a complete oyster survey.

*Necessary foundation for an oyster survey.*—Consequently, the necessary components of a satisfactory foundation for a complete oyster survey are the three classes of survey operations technically named triangulation, topography, and hydrography, or, stated in another way, the foundation of a practical oyster survey includes the surveying operations usually followed by the Coast and Geodetic Survey leading up to the preparation and publication of nautical charts.

*Special surveys and investigations pertaining to oysters.*—Having obtained this cartographic survey for a foundation, partly by new work and partly from records of previous work of the Government, the combined operations<sup>1</sup> making up an "oyster survey" are completed by superimposing on this foundation special surveys and investigations pertaining particularly to oysters or other shell fish.

The special surveys pertaining to oysters furnish information as to the location and outline of oyster-shell bottoms, and are carried on by the sounding boat party in addition to the usual hydrographic work.<sup>2</sup> This operation consists of the observation and record of the character of vibration of a wire and chain apparatus which is dragged over the bottom, the vibrations or lack of vibrations indicating the presence and quantity of shells or absence of shells.

The special oyster investigations<sup>3</sup> consist of the actual determination of the kind and quantity of oysters on the bottom, and such economic and biological studies of the supply of oyster food, density of water, character of the bottom, and other important matters as affect the growth of oysters. In this work the oyster investigation stations are located and buoyed by the hydrographic party while engaged in the survey of the oyster-shell limits. They are selected with the view of obtaining characteristic data which can be used for the interpretation of the recorded vibrations of the chain apparatus at all other points covered by the survey.

*Preparation of results.*—The actual surveying operations and oyster investigations having been completed for any one county, there still remains technical work of nearly equal magnitude to that described.<sup>4</sup> This work consists of the preparation of charts and technical descriptions of boundaries and landmarks for publication by the Government, the preparation of that part of the annual report of the Commission covering the special oyster surveys and investigations, the making of the leasing charts and finished projections, and finally the filing of the oyster charts and records with the courts and the Commission, thus opening a county for oyster culture.

*Summary.*—From the foregoing account it can be seen that a complete oyster survey properly conducted so as to answer all practical requirements of the present and permanency of results for the future is a very complicated affair, involving many lines of surveying and other scientific work, and requiring the professional services of experts in the various operations of cartographic surveying and shell-fish investigations.

<sup>1</sup> See Appendix D of this publication for "Statistics of results of combined operations of the Government and State."

<sup>2</sup> See pages 104-123 of "First Annual Report of Maryland Shell Fish Commission."

<sup>3</sup> See pages 30-67 and 129-199 of "First Annual Report of Maryland Shell Fish Commission."

<sup>4</sup> No mention is made here of the large amount of administrative work of the commission, which is greatly complicated and increased by the effect of the oyster-survey operations on many thousands of people whose interests are more or less involved; or of the large amount of survey work involved in the survey and record of the boundaries of oyster lots leased from the State by private individuals for the purposes of oyster culture.

APPENDIX D.—STATISTICS OF RESULTS OF THE COMBINED OYSTER SURVEY OPERATIONS OF THE GOVERNMENT AND STATE.<sup>1</sup>

Operations.	Anne Arundel County.	Somerset County.	Wicomico County.	Worcester County.	Calvert County.	Charles County.	St. Marys County.	Total. <sup>2</sup>
Beginning of field work . . . . .	June 29, 1906	May 2, 1907	Aug. 27, 1907	Nov. 8, 1907	May 2, 1908	Aug. 18, 1908	May 2, 1908	.....
Filing of certified charts and reports . . . . .	June 20, 1907	July 1, 1908	Dec. 1, 1908	Apr. 12, 1909	Dec. 14, 1909	Jan. 27, 1911	July 6, 1911	.....
Natural oyster bars surveyed and delineated . . . . .	91	37	15	28	41	15	124	351
Acres of natural oyster bars . . . . .	33,666	27,506	2,038	1,655	12,393	2,285	25,778	105,291

COAST AND GEODETIC SURVEY

## LETTER OF SUBMITTAL.

---

DEPARTMENT OF COMMERCE AND LABOR,  
COAST AND GEODETIC SURVEY,  
*Washington, June 29, 1908.*

SIR: I have the honor to transmit herewith the report of the officer detailed from the Coast and Geodetic Survey to cooperate with the Bureau of Fisheries and the Maryland Shell Fish Commission in surveying the oyster bars of the State of Maryland, and certain technical results which are necessary for the interpretation and use of the plats of the survey made by the Government.

This work has been done under the provisions of the act of Congress entitled "An act to authorize the Secretary of Commerce and Labor to cooperate, through the Bureau of the Coast and Geodetic Survey and the Bureau of Fisheries, with the shellfish commissioners of the State of Maryland in making surveys of the natural oyster beds, bars, and rocks in the waters within the State of Maryland," approved May 26, 1906, and of the acts of Congress making appropriations for sundry civil expenses of the Government for the fiscal years ending June 30, 1907, 1908, and 1909.

Respectfully,

O. H. TITTMANN, *Superintendent.*

To Hon. OSCAR S. STRAUS,  
*Secretary of Commerce and Labor.*

## CERTIFICATION.

---

ANNAPOLIS, MD., *June 25, 1908.*

The following publication is certified to contain correct technical descriptions of all boundaries and landmarks established in the waters of Somerset County by the Maryland Shell Fish Commission in cooperation with the United States Coast and Geodetic Survey.

C. C. YATES,  
*Chief of Coast and Geodetic Survey Party,*  
*Assistant, Coast and Geodetic Survey.*

---

ANNAPOLIS, MD., *June 25, 1908.*

Examined and certified to be correct.

WALTER J. MITCHELL,  
CASWELL GRAVE,  
BENJAMIN K. GREEN,  
*Maryland Shell Fish Commissioners.*  
SWEPSON EARLE,  
*Hydrographic Engineer.*

NOTE.—As required by law, certified copies of this publication and of the charts of the natural oyster bars of "Somerset County and adjacent waters" were filed in the office of the clerk of the circuit court of Somerset County and in the office of the Board of Shell Fish Commissioners, at Annapolis, on July 1, 1908.

# SURVEY OF OYSTER BARS, SOMERSET COUNTY, MD.

## INTRODUCTION.

### PUBLICATIONS.

The preparation of publications relating to the survey of the oyster bars, crab bottoms, and clam beds of Maryland has been divided between the Government and the State in accordance with the laws <sup>a</sup> authorizing the work and the natural division of the surveying operations of the cooperating forces.

The publications prepared and issued by the Government under the direction of the Superintendent of the Coast and Geodetic Survey consist of a series of charts and a technical report for each county surveyed.<sup>b</sup> The charts show all legal boundaries of oyster bars, crab bottoms, and clam beds within the adopted boundaries of the waters opened up for leasing with each county, and the location of all landmarks (Coast and Geodetic Survey triangulation stations) used as a foundation for the delineation of these various boundaries. The technical report gives technical and legal descriptions of all oyster bar and other boundaries, and descriptions of all landmarks shown on the charts, and includes the report <sup>c</sup> of the representative of the Coast and Geodetic Survey in charge of the work of that Service in cooperation with the Bureau of Fisheries and the Maryland Shell Fish Commission. These charts and technical reports are prepared and certified for file with the courts and the Commission, as required by the laws of the State, and contain all information necessary to make a permanent record of the work of the Commission and the Government for all future requirements of the courts, or for any resurveys that may become necessary.

The part prepared and issued by the State under the direction of the Shell Fish Commission consists of an annual report <sup>d</sup> of all the operations of the Commission performed under the provisions of the laws of Maryland,<sup>e</sup> including results of biological and economic oyster investigations, methods and results of the hydrographic survey of the boundaries of oyster bars and crab bottoms, the administrative report and financial statement of the Commission, information relating to oyster culture, methods of sur-

<sup>a</sup> See Appendix A for laws relating to the cooperation of the Coast and Geodetic Survey and Bureau of Fisheries with the Maryland Shell Fish Commission.

<sup>b</sup> These charts and technical reports can be obtained by application to the Superintendent of the Coast and Geodetic Survey, at Washington, D. C. The publications ready for issue are those of Anne Arundel and Somerset counties. Those of Wicomico and Worcester counties are now being prepared.

<sup>c</sup> See page 16 and the progress map attached to this publication.

<sup>d</sup> These reports can be obtained by application to the Shell Fish Commission, Annapolis, Md. They are issued annually in October, and the first report is now available for distribution.

<sup>e</sup> See Appendix D for an extract from the "First Report of the Maryland Shell Fish Commission," giving a concise summary of the "Haman Oyster Culture Law."

veying and leasing of oyster lots, and much other important matter of legal and scientific value.

These two sets of publications are planned and arranged to supplement each other without unnecessary duplication, and when combined they form a complete report of operations, methods, and results of the work of both the Government and State.

#### COOPERATION OF THE COAST AND GEODETIC SURVEY.

The work of the Coast and Geodetic Survey, as the name of the Service indicates, includes a survey of the coasts of the United States made on a geodetic basis. This has involved the gradual construction of a great framework of interstate triangulation for use as a foundation for detail hydrographic and topographic surveys, from which there has been compiled and published a complete set of charts of the coasts of the United States, including all waters of Maryland where oysters grow. This existing triangulation, hydrography, and topography is essential for a correct and practical survey of natural oyster bars; and it being one of the fundamental functions of the Coast and Geodetic Survey to furnish such data, the cooperation of the Coast and Geodetic Survey with the Bureau of Fisheries and the Maryland Shell Fish Commission is a practical and natural development of Government work leading to the conservation and increase of the supply of food.

#### COOPERATION OF THE BUREAU OF FISHERIES.

The Bureau of Fisheries has cooperated with the Coast and Geodetic Survey and the Maryland Shell Fish Commission principally as an advisor in matters relating to the biological and economic survey of oyster bars and the methods to be employed for that purpose.<sup>a</sup> A steam launch, rowing boat, and certain apparatus have also been furnished.

The primary function of the Bureau of Fisheries is to increase the productiveness of marine and fresh waters by such measures as may be best suited to the purpose, and the services rendered in connection with the survey of the oyster bars of Maryland are strictly in line with the fundamental law under which it acts. In certain States other than Maryland similar work has been conducted by the Bureau acting independently, the same ends being attained at greater expense to the Government.

#### GENERAL REMARKS.

A brief account of the particular surveying operations which constitute an "oyster survey" as now being carried on in Maryland will assist in the interpretation of records contained in the technical part of this report, and will be of interest to the many who may not understand the necessity for the great amount of work being done or its complicated character.

To those familiar with surveying methods on open waters the necessity for the various operations performed are evident, especially when it is known that the boundaries of the public oyster bars and of the private lots leased for purposes of oyster culture must be surveyed and charted with the greatest attainable accuracy. To others it will be

<sup>a</sup> Hon. George M. Bowers, Commissioner of Fisheries, has detailed for this service Dr. H. F. Moore, Assistant, Bureau of Fisheries.

sufficient to state that the actual experience gained from oyster surveys in other States has proven that to accurately locate and permanently establish oyster boundaries as is now being done in Maryland is necessary if endless dissatisfaction and future litigation are to be avoided.

Such refinement of survey work as demanded by the conditions of an oyster survey when carried on at considerable distances offshore can only be obtained by the use of a system of triangulation as a framework or foundation. Therefore, a triangulation survey including the permanent marking of the positions of landmarks with monuments and a record of the descriptions of their locations for future recovery is a necessary operation of a complete oyster survey.

The technical records which established the relation between the offshore oyster boundaries and triangulation landmarks are sufficient for the requirements of engineers in making resurveys, but do not supply the needs of others who are interested in the same boundaries by reason of their occupation as oystermen concerned as to the public oyster bars, or oyster culturists concerned as to the barren bottoms. For these it is necessary to have the charts of the survey show the relation of the shore line and other topographic features to the boundaries of the public oyster bars and private oyster farms. Therefore, a topographic survey is a necessary operation of a complete oyster survey.

In the settlement of the important question of what is, or what is not, a natural oyster bar, and in the consideration of bottoms to be selected for purposes of oyster culture, information as to the depth of water and the character of the bottom is required. Therefore, a hydrographic survey is a necessary operation of a complete oyster survey.

Consequently, the necessary components of a satisfactory foundation for a complete oyster survey are the three classes of survey operations technically named triangulation, topography, and hydrography, or, stated in another way, the foundation of a practical oyster survey includes the surveying operations usually followed by the Coast and Geodetic Survey leading up to the preparation and publication of navigational charts.

Having obtained this cartographic survey for a foundation, partly by new work and partly from records of previous work of the Government, the combined operations <sup>a</sup> making up an "oyster survey" are completed by superimposing on this foundation special surveys and investigations pertaining particularly to oysters or other shell fish.

The special surveys pertaining to oysters furnish information as to the location and outline of oyster-shell bottoms and are carried on by the sounding boat party in addition to their usual hydrographic work.<sup>b</sup> This operation consists of a record of the character of vibration of a wire and chain apparatus which drags over the bottom. The vibrations or lack of vibrations indicating the presence or absence of shells.

The special oyster investigations <sup>c</sup> consist of the actual determination of the kind and quantity of oysters on the bottom, and such economic and biological studies of the supply of oyster food, density of water, character of the bottom, and other important

<sup>a</sup> See Appendix C of this publication for "Statistics of results of combined operations of the Government and State."

<sup>b</sup> See pages 104 to 123 of "First Annual Report of Maryland Shell Fish Commission."

<sup>c</sup> See pages 30 to 67 and 129 to 199 of "First Annual Report of Maryland Shell Fish Commission."

matters as affect the growth of oysters. In this work the oyster investigation stations are located and buoyed by the hydrographic party while engaged in the survey of the oyster-shell limits. They are selected with the view of obtaining characteristic data which can be used for the interpretation of the recorded vibrations of the chain apparatus at all other points covered by the survey.

The actual surveying operations and oyster investigations having been completed for any one county, there still remains technical work of nearly equal magnitude to that described.<sup>a</sup> This work consists of the preparation of charts and technical descriptions of boundaries and landmarks for record and publication by the Government, the manufacture and planting of the "State buoys" at all corners of the oyster-bar boundaries, the preparation of that part of the annual report of the Commission covering the oyster investigations, the making of the leasing charts and finished projections, and finally the survey and record of the boundaries of oyster lots leased from the State by private individuals for the purposes of oyster culture.

From the foregoing account it can be seen that a complete oyster survey properly conducted so as to answer all practical requirements of the present and permanency of results for the future is a very complicated affair, involving many lines of surveying and other scientific work, and requiring the professional services of experts in the various operations of cartographic surveying and shell-fish investigations.

## REPORT OF THE WORK OF THE COAST AND GEODETIC SURVEY.

### INSTRUCTIONS.

The two following letters, together with the laws<sup>b</sup> of the United States relating to the subject, constitute the "instructions" received by the chief of the Coast and Geodetic Survey party engaged on work in connection with the Maryland Shell Fish Commission. They are short and definite, but furnish ample authority and leeway for all legitimate development of the cooperation of the Government and the State in the survey of oyster bars. The "free hand" permitted by these orders, together with the aid and many valuable suggestions received from the officers of the Survey at Washington, has proved very beneficial to the work, and is greatly appreciated.

DEPARTMENT OF COMMERCE AND LABOR,  
OFFICE OF THE SECRETARY,

*Washington, June 2, 1906.*

SIR: In reply to your letter of May 28, requesting me to designate officers of the Coast and Geodetic Survey and of the Bureau of Fisheries to cooperate with the State of Maryland in making survey of and locating the natural oyster beds, I have the honor to inform you that Mr. C. C. Yates will be designated to cooperate on the part of the Coast and Geodetic Survey as soon as Congress makes the provisions of the act effective by providing an appropriation for the purpose.

Respectfully,

LAWRENCE O. MURRAY, *Assistant Secretary.*

His excellency HON. EDWIN WARFIELD,  
*Governor of Maryland, Annapolis, Md.*

<sup>a</sup> No mention is made here of the large amount of administrative work of the Commission, which is greatly complicated and increased by the economic and political effect of the oyster-survey operations on many thousands of people whose interests are more or less involved.

<sup>b</sup> For these laws see Appendix A.

DEPARTMENT OF COMMERCE AND LABOR,  
COAST AND GEODETIC SURVEY,  
Washington, July 3, 1906.

SIR: Upon the receipt of these instructions you will surrender the command, accounts, etc., of the steamer *Endeavor* to the Hydrographic Inspector. \* \* \*

As soon as this transfer is completed you will enter upon the duties of Coast Survey representative on the Shell-Fish Commission of Maryland.

You will consult the commissioners, prepare a programme of work, and submit estimates in the usual form.

You are authorized to come to Washington for consultation from time to time as may be necessary.

\* \* \* \* \*

Very respectfully,

O. H. TITTMANN, *Superintendent.*

Capt. C. C. YATES,

*U. S. C. and G. S. Steamer Endeavor, Baltimore, Md.*

ORGANIZATION.

The organization of the party has remained practically unchanged and consists of the chief and the necessary triangulators, computers, and draftsmen.

EQUIPMENT.

The equipment for the work of the party has been ample and satisfactory. The large living and office quarters furnished the Government on the Maryland Shell Fish Commission house boat *Oyster* have been very convenient for the work, besides facilitating efficient cooperation with the surveying and oyster investigation parties of the State. In addition to the accommodations on the *Oyster* the Coast and Geodetic Survey party has had the constant use of the large steam launch *Inspector* and several other boats furnished by their own Service, and the occasional use of the Bureau of Fisheries launch *Canvasback*<sup>a</sup> and the steamer *Governor McLane*<sup>b</sup> of the State fishery force.

The greater part of the equipment of instruments for the operations of both the Government and State have been furnished by the Coast and Geodetic Survey and consist of all necessary theodolites, levels, sextants, drafting instruments, hydrometers, etc., required for all field and office work.

CHRONOLOGICAL STATEMENT OF WORK.<sup>c</sup>

On June 20, 1907, the "Charts of Natural Oyster Bars" and report<sup>d</sup> of "Survey of Oyster Bars" for Anne Arundel County were issued and filed, and the survey records and reports for that county have been filed in the archives of the Survey at Washington.

In addition to this work, a Coast and Geodetic Survey signal-building party was engaged in the erection of triangulation signals in Somerset County from May 2 to June 25 in cooperation with a signal-building party of the Shell Fish Commission.

<sup>a</sup> By courtesy of Dr. H. F. Moore, U. S. Bureau of Fisheries.

<sup>b</sup> By courtesy of Capt. James A. Turner, commanding.

<sup>c</sup> The field and office work relating to Somerset County is so intermixed with that of Wicomico County that this statement includes part of the work of the latter county.

<sup>d</sup> See this report for an account of the work from July 3, 1906, to June 20, 1907.

From June 25 to November 6, when the field work in Somerset and Wicomico counties was practically completed, the usual routine of field and office work was followed without material interruption except that resulting from the moving of the house boat *Oyster* from Crisfield to Manokin River on July 13, then to Piney Island on August 27, and to Wicomico River, on August 30, where she remained until her removal to Nanticoke River on September 30.

From this latter date the work in Wicomico County predominated, and when the field surveys were practically completed on November 6 the entire party left by rail for Worcester County, it being impracticable to move the house boat to the waters of that locality.

At the close of the survey work in Worcester County in the last part of December, office work relating to Somerset and Wicomico counties was actively commenced at Baltimore<sup>a</sup> and was continued without material interruption until March 23, 1908, when a subparty went to Worcester and Somerset counties to finish some details of field work in those sections required for the preparation of the technical reports and oyster charts.

The very large amount of work of computation and drafting necessary to make the results of the survey of the previous season available for publication was nearly completed on May 2, when it was transferred to the Government quarters on the house boat *Oyster*, which left Baltimore on the same day with the party and outfit for her anchorage off Solomons Island, in the Patuxent River.

The active field work in Calvert County dates from May 2, but from that time until the filing of this report and the oyster charts of Somerset County the chief of party, in addition to his regular field duties, was frequently at Baltimore and Washington to look after their final preparation for publication.

STATISTICS.<sup>b</sup>

Landmarks and triangulation signals erected.....	60
Monuments planted to mark triangulation stations.....	61
Triangulation stations occupied for observations of horizontal angles.....	66
Old triangulation stations recovered.....	24
New triangulation stations established.....	62
Total old and new triangulation stations marked and described.....	86
Linear miles of shore line covered by triangulation (approximate).....	125
Square miles covered by triangulation (approximate).....	375
Hydrographic projections prepared and completed as records of oyster, crab, and clam boundaries.....	13
Triangles computed.....	209
Geographic positions computed.....	76

<sup>a</sup> Office rooms were furnished for the work of the Government party in the "old court-house" and afterwards in the new custom-house by courtesy of Hon. William F. Stone, collector of customs.

<sup>b</sup> These statistics only include field and office work directly performed by the party of the Coast and Geodetic Survey in connection with the oyster survey of Somerset County, and do not include the many thousands of soundings and examinations of the character of the bottom made by the engineers of the Commission, which are of considerable value to the Coast and Geodetic Survey as hydrographic records for future use in connection with the preparation of new editions of charts of the waters of Maryland.

Corners of oyster, crab, and clam boundaries established by computation.....	506
Back azimuths and distances computed from corners of boundaries to triangulation stations....	1, 518
Descriptions of triangulation stations prepared for publication.....	86
Descriptions of oyster, crab, and clam boundaries prepared for publication.....	94
Total typewritten pages of manuscript prepared for publication of report.....	264
"Charts of Natural Oyster Bars" prepared for publication.....	6
Progress map prepared for publication.....	1

GENERAL STATEMENT.

The results obtained from the work of the Coast and Geodetic Survey in Somerset County in cooperation with the Bureau of Fisheries and the Maryland Shell Fish Commission need no other summary than is indicated by the published "Charts of Natural Oyster Bars" and the scheme of hydrographic projections and triangulation stations shown on the progress map at the beginning of this report.

The triangulation has been carried on in accordance with the standard methods of the Coast and Geodetic Survey, making this work and that of the "Descriptions of Triangulation Stations" of permanent value, not only to the State of Maryland in the survey of her oyster bars, but also to the Government for any future work it may do in the regions covered by the oyster survey operations.

The hydrographic projections and published charts were prepared with all the accuracy permitted by their large scale, especially as to the boundaries of the various shell-fish bottoms in relation to landmarks, but this accuracy of location on the charts is further added to by published technical descriptions which should minimize the probability of any future dispute as to either landmarks or boundaries.

Stated another way and quoting from the report of the "Survey of Oyster Bars of Anne Arundel County:"

The geographic positions of the permanent landmarks and signals have been determined with the usual precision of a trigonometric survey, and their locations at all points necessary to provide ample foundation for the surveying and charting operations permitted great accuracy of definition and location for the natural oyster bar and other boundaries established. At the same time, the very important element of permanency of the positions of boundaries has been secured, as the relocation of geodetic positions can always be accomplished by a competent surveyor, even though the original landmarks and monuments have been washed away, as has been the fate of hundreds of such points established by the Coast and Geodetic Survey on the shores of the Chesapeake Bay during the last sixty-five years.

In fact, when the survey of the oyster bars of Maryland is completed, it is believed that it will stand the test of time and practical use as a working foundation for whatever form the oyster legislation of the future may assume; and that the doing of the work systematically and accurately, once for all, not only means a better foundation of a great oyster industry by irradicably locating the natural oyster bars for the use of the public, but also a better and more permanent superstructure of oyster culture for the individual by the reason of the integrity of the foundation on which it stands.

Before ending this report the representative of the Coast and Geodetic Survey wishes to renew his statement of appreciation of the courteous assistance received from various Government and State officials and others interested in the oyster industry of Maryland, especially to the following:

To his colleague from the Department of Commerce and Labor, Dr. H. F. Moore of the Bureau of Fisheries, whose efficient cooperation, well-known experience, and scientific knowledge of all matters relating to oysters have been of great value to the work.

To Mr. Walter J. Mitchell, chairman of the Maryland Shell Fish Commission, who, by his administrative ability in carrying out the complicated requirements of the oyster laws and by his unflinching tact, has made the cooperation of the various services engaged on the work both agreeable and effective.

To Dr. Caswell Grave, secretary of the Commission, who, as editor of the Commission's annual report and commissioner in charge of the biological and economic oyster investigations, has been brought into constant contact with the Government work and aided its operations in every way.

To Benjamin K. Green, treasurer of the Commission, who has looked after the equipment and commissary of the house boat in such a way as to add greatly to the comfort and convenience of the party of the Coast and Geodetic Survey.

To Swepson Earle, hydrographic engineer to the Commission, whose knowledge of the work from former service in the Coast and Geodetic Survey has greatly facilitated his practical use of the technical data furnished by the Government.

To Thomas H. Robinson, counsel to the Commission, for courteously furnishing valuable information relating to county boundaries.

And to the many others connected with the Commission or who as residents in the locality where the work was being carried on have greatly assisted by furnishing important information or willing services.

## CHARTS AND MAPS.

### CHARTS OF NATURAL OYSTER BARS.

The charts<sup>a</sup> of the natural oyster bars of "Somerset County and Adjacent Waters," published by the Coast and Geodetic Survey from results of surveys of the Government in cooperation with the Maryland Shell Fish Commission, consist of a series of five sheets covering the eastern shore of Chesapeake Bay from Hooper Strait to the Maryland-Virginia boundary, including Tangier and Pocomoke sounds and numerous other tributaries. They are published on a scale of 1 part in 20,000 (approximately  $3\frac{1}{8}$  inches to a statute mile) and are constructed on polyconic projections and based on the United States standard datum of the Coast and Geodetic Survey.

These charts show all oyster bars, crab bottoms, clam beds, and other boundaries established by the Commission, and are certified for the purpose of filing in the office of the clerk of the circuit court of Somerset County and in the office of the Commission at Annapolis, as required by the oyster laws of Maryland.

In addition to the oyster-bar and other boundaries, the charts show the location and name of all landmarks (U. S. Coast and Geodetic Survey triangulation stations) used in making the survey, together with the hydrography and topography<sup>b</sup> necessary to make the technical definitions and delineations of boundaries readily understandable

<sup>a</sup> These charts can be obtained by application to the Superintendent of the Coast and Geodetic Survey, at Washington, D. C.

<sup>b</sup> Much of the details of the inshore topography was obtained from the excellent map of Somerset County prepared and published by the Maryland Geological Survey under the direction of Dr. William Bullock Clark from surveys of the Maryland Geological Survey in cooperation with the U. S. Geological Survey.

both by the people engaged in the oyster industry and the general public who may become interested through leasing of barren bottoms for oyster culture.

The names of the oyster bars, crab bottoms, and clam beds are those used locally, as nearly as could be ascertained by the hydrographic engineer of the Commission. When there was no local name in common use, as was generally the case with the crab bottoms, a name was selected from one of the prominent features of the vicinity. By the use of recognized names or those that would naturally suggest certain sections of water, it is believed that much confusion will be avoided in the location on the charts of the oyster bars and crab bottoms, especially by those not familiar with the use of maps.

The corners of the oyster bars, crab bottoms, and clam beds are numbered from 1 to the total number of corners in each area under consideration. Where boundaries adjoin, making one point a corner of two or more oyster bars, crab bottoms, or clam beds, as the case may be, these points have two or more numbers, each number corresponding to the bar, bottom, or bed in which the figure is located. The numbers of the corners correspond with the technical and legal descriptions of this publication under the headings of "Boundaries of natural oyster bars," "Boundaries of crab bottoms," and "Boundaries of clam beds."

The landmarks, oyster bars, crab bottoms, and clam beds have been grouped in the "Contents" of this publication in accordance with the charts upon which they are shown. To find a particular bar, bottom, bed, or landmark which is only known by name, consult the "Contents" and the desired chart and general location will be indicated. To find the name of a bar, bottom, bed, or landmark which is only known by location, consult the progress map at the beginning of this publication for the number of the chart on which it is to be found, and then examine the known locality on the chart for the name of the bar, bottom, bed, or landmark in question.

The contours on the charts showing the depth of water at mean low tide have been taken from the hydrographic sheets of former work of the Coast and Geodetic Survey. Four curves were selected as being the most convenient for taking off from the original hydrographic sheets and the ones of greatest value to those interested in shell-fish industries. The 1-fathom contour (6 feet) corresponds in a general way to the outer limits of the crab bottoms, while the waters outside of this curve and inside the 5-fathom contour (30 feet) practically include all the oyster bars surveyed. The 3-fathom contour (18 feet) furnishes the curve of about the average depth of water on the oyster bars and the 10-fathom contour (60 feet) serves in a general way to indicate the outer limits of probable oyster culture.

The boundaries of the waters within the "territorial limits of the county" and the boundaries of the "waters contiguous to the county" opened up for the leasing with Somerset County are plainly indicated on the charts. A full technical description of these boundaries is given in this publication under the heading "Boundaries of county waters."

The areas in acres of the oyster bars, crab bottoms, and clam beds were determined under the direction of the hydrographic engineer of the Commission by two independent planimeter measurements of the areas as delineated on the smooth projections of the

Coast and Geodetic Survey. These areas are given in small figures in parentheses on the face of the chart and are usually located within the boundaries of the different areas.

The symbols used on the charts for the different kinds of boundaries, triangulation stations, contours of depth of water, etc., require no other explanation than that given in the legend and other notes on the face of the charts.

#### LEASING CHARTS.

The leasing charts of Somerset County, like those for Anne Arundel County, have been prepared under the direction of the hydrographic engineer of the Commission. These charts are constructed on polyconic projections and based on the United States standard datum of the Coast and Geodetic Survey. They are made on the scales of 1 part in 5,000 or 1 part in 10,000, as the needs of oyster culture may require. Anne Arundel County required 13 leasing charts and Somerset County 12 to cover their oyster bottoms.

These charts show all the oyster bars, crab bottoms, and clam beds and other boundaries established by the Commission, and also all boundaries of oyster lots leased for the purpose of oyster culture, thus making them comprehensive and valuable records of the results of the operations of the oyster-culture laws.

The lots leased under the provision of the "old 5-acre law" are frequently of irregular shape, but the lots leased under the provision of the new oyster laws must be of rectangular shape by the terms of that act. For this latter purpose the leasing charts have been divided by parallels of latitude and meridians of longitude into small rectangles of 1 acre or 5 acres, as may be best suited to area under consideration, and prospective leaseholders by the rules of the Commission are compelled to select whole rectangles as far as practicable.

For reasons of the present changeable nature of the number of lots leased and the large number of charts required, the leasing charts are not likely to be published for some years, but they can be seen at any time on file at the offices of the Commission, in Annapolis.

#### PROJECTIONS.

The polyconic projections<sup>a</sup> covering Somerset County waters are 13 in number and on the scale of 1 part in 10,000. They were all constructed by draftsmen of the Coast and Geodetic Survey, who also plotted the sextant positions on the smooth projections which determine the location of the legal boundaries of the oyster bars, crab bottoms, or clam beds as delineated by the Shell Fish Commission.

A copy of each of these projections, with all the plotted positions of triangulation stations, shore line, sextant positions, and boundaries of oyster bars, was made under the direction of the hydrographic engineer of the Commission by pricking through with a sharp needle the intersections of the projection lines and all other points as plotted on the original sheets.

These projections (in duplicate) are the original records of all oyster bar and other boundaries established by the Commission, one set being filed in the archives of the Coast and Geodetic Survey, at Washington, and the other set in the office of the Shell Fish Commission at Annapolis.

<sup>a</sup> For the scheme of these projections see the progress map at the beginning of this publication.

## PROGRESS MAPS.

The progress map to be found at the beginning of this publication is on a scale of 1 part in 100,000, and shows in outline the work accomplished by the U. S. Coast and Geodetic Survey in Somerset County and contiguous waters. It gives the scheme of all the charts and smooth projections constructed in connection with the survey, the location and names of all triangulation stations used as a basis for the surveying work, and the "boundaries of county waters" established by the Commission for the purpose of carrying out the laws of Maryland relating to oyster culture.

Besides indicating the amount of work done by the Coast and Geodetic Survey in connection with the work of the Shell Fish Commission, this progress map will be of special value for index purposes to engineers and others searching for the particular chart or projection covering the locality of the oyster bars or landmarks that may be under consideration.

The progress map<sup>a</sup> accompanying the "First Annual Report of the Maryland Shell Fish Commission" was prepared under the direction of the hydrographic engineer of the Commission. It is on the scale of 1 part in 400,000 and shows the outline of the tide-water counties of Maryland, with shaded areas to indicate the waters already covered by the operations of the oyster survey of Maryland.

BOUNDARIES OF COUNTY WATERS.<sup>b</sup>

## WATERS WITHIN TERRITORIAL LIMITS OF COUNTY.

The laws of Maryland relating to oyster culture provide that "no person shall be permitted, by lease, assignment, or in any other manner, to acquire a greater amount of land than ten acres situated within the territorial limits of any of the counties, or one hundred acres in any other place."

The boundary line<sup>c</sup> between the waters "within the territorial limits" of Somerset County and the waters in "any other place," as established by the Shell Fish Commission for the purpose of carrying out the oyster laws, and delineated on the charts and the smooth projections of the Coast and Geodetic Survey, is technically described and defined as follows:

Commencing at a point defined by the intersection of the channels of Wicomico Creek and Wicomico River; thence with the channel of Wicomico River along the boundary line as laid down on Chart No. 5 of the "Natural Oyster Bars" of Maryland, published by the Coast and Geodetic Survey, to a point defined by the intersection of the channel of Nanticoke River with Wicomico River; thence in a straight line to a point defined by<sup>d</sup> latitude  $38^{\circ} 11' 50''$ 3, and longitude  $75^{\circ} 58' 20''$ 8, situated in upper end of

<sup>a</sup> This map and report can be obtained by application to Maryland Shell Fish Commission, at Annapolis, Md.

<sup>b</sup> For a complete historical and legal description of the boundaries of the counties of Maryland, the valuable publication entitled "The Counties of Maryland—Their Origin, Boundaries, and Election Districts," prepared by Dr. Edward B. Mathews and published by the Maryland Geological Survey under the direction of Dr. William Bullock Clark, Superintendent, should be consulted, as the boundaries described in this publication have been established and technically defined for the purpose of carrying out the oyster laws of the State, and may or may not be correct for other purposes.

<sup>c</sup> See "Charts of Natural Oyster Bars," published by the Coast and Geodetic Survey, and the progress map at the beginning of this publication.

<sup>d</sup> Latitudes and longitudes based on the United States standard datum of the U. S. Coast and Geodetic Survey.

Tangier Sound, about  $\frac{1}{8}$  mile <sup>a</sup> east-southeast of Sharkfin Shoal Light,  $2\frac{1}{4}$  miles south of western extremity of Clay Island, and  $1\frac{3}{4}$  miles west-northwest of Halls Point; thence in a straight line along the channel of Tangier Sound to a point defined by latitude  $38^{\circ} 10' 08''.1$ , and longitude  $75^{\circ} 58' 40''.6$ , situated about  $2\frac{3}{8}$  miles south by east of Sharkfin Shoal Light and  $1\frac{1}{8}$  miles west of upper land end of Deal Island; thence in a straight line across Tangier Sound to a point defined by latitude  $38^{\circ} 08' 50''.6$ , and longitude  $76^{\circ} 01' 53''.4$ , situated on a point of land on the southeastern extremity of Bloodworth Island, which is the north point of the Tangier Sound entrance to Holland Straits; thence in a straight line across Holland Straits to a point defined by latitude  $38^{\circ} 06' 39''.9$ , and longitude  $76^{\circ} 03' 17''.8$ , situated on northwest extremity of a small island slightly detached from South Marsh and on north side of Holland Straits entrance to Pry Cove; thence in a straight line to a point defined by latitude  $38^{\circ} 05' 44''.1$ , and longitude  $76^{\circ} 03' 44''.6$ , situated on Pry Island, which is located on south side of Holland Straits entrance to Pry Cove; thence in a straight line to the open waters of the Chesapeake Bay at point defined by latitude  $38^{\circ} 04' 40''.8$ , and longitude  $76^{\circ} 04' 14''.8$ , situated at junction of Holland and Kedge Straits; thence in a straight line along the dividing waters of Chesapeake Bay and Kedge Straits to a point defined by latitude  $38^{\circ} 02' 07''.0$ , and longitude  $76^{\circ} 02' 34''.0$ , situated on the northwest side of Fog Point, which is the south point of the Chesapeake Bay entrance to Kedge Straits; thence along the mean low water line of the Chesapeake Bay shore of Smith Island across the mouth of all inlets less than 100 yards in width to a point defined by latitude  $38^{\circ} 00' 31''.0$ , and longitude  $76^{\circ} 03' 08''.9$ , situated on a point at the extreme northwest entrance to Smith Island Thoroughfare; thence in a straight line across the Chesapeake Bay entrance of Smith Island Thoroughfare and Goose Harbor Cove to a point defined by latitude  $37^{\circ} 59' 30''.0$ , and longitude  $76^{\circ} 03' 09''.6$ , situated on a point at the extreme southwest entrance to Goose Harbor Cove; thence along the mean low water line of Chesapeake Bay shore of Smith Island across the mouth of all inlets less than 100 yards in width to the intersection of the mean low water line and the Maryland-Virginia boundary line; thence in a straight line with the Maryland-Virginia boundary across Smith Island and the waters of Smith Gut, Shanks Creek, and Tylers Creek to a point at a corner of the boundary near the Tangier Sound shore of Smith Island situated on land known locally as Horse Hummock; thence in a straight line with the Maryland-Virginia boundary to point at a corner of the boundary in the middle of Tangier Sound, situated about  $1\frac{1}{8}$  miles southwest by west of James Island Light,  $2\frac{3}{8}$  miles east by south of Horse Hummock, and  $3\frac{1}{4}$  miles northwest of House Island; thence in a straight line with the Maryland-Virginia boundary to a point at a corner of the boundary in the middle of Tangier Sound, situated about  $4\frac{3}{8}$  miles southwest by south of James Island Light,  $3\frac{1}{8}$  miles southeast by east of Horse Hummock, and  $2\frac{5}{8}$  miles west of House Island; thence in a straight line with the Maryland-Virginia boundary across House Island to a corner of the boundary situated in the water between Watkins Point and Green Harbor Island; thence in a straight line with the Maryland-Virginia boundary to a corner of the boundary situated in the middle of Pocomoke Sound about  $4\frac{1}{4}$  miles east of Watkins Point and  $2\frac{5}{8}$  miles south of Watkins Island off entrance to Apes Hole Creek; thence in a straight line with the Maryland-Virginia boundary to a corner of the boundary situated in the middle of Pocomoke Sound about  $2\frac{1}{4}$  miles northwest by west of Saxis Church,  $2\frac{1}{4}$  miles east by south of Watkins Island off entrance to Apes Hole, and 2 miles southwest of extreme end of point between East and Marumscro creeks; thence with the Maryland-Virginia boundary as laid down on "Charts of Natural Oyster Bars" No. 10 along the middle of Pocomoke Sound and Pocomoke River as far as oysters grow.

WATERS CONTIGUOUS TO COUNTY.

The oyster laws of Maryland provide that a true and accurate delineation of all natural oyster bars shall be made on copies of charts of the U. S. Coast and Geodetic Survey, "which said copies shall be filed in the office of the said Commissioners in the city of Annapolis," and "in the office of the clerks of the circuit courts for the respective counties wherein the grounds so designated may lie."

For the purpose of carrying out the latter part of this section of the law and for the purpose of establishing the limits of the oyster-culture area to be opened up for the

<sup>a</sup> Statute miles.

leasing with Somerset County, a boundary line between the waters contiguous to but not within the territorial limits of Somerset County and the waters contiguous to but not within the territorial limits of adjacent counties has been established by the Shell Fish Commission. This boundary line<sup>a</sup> has been delineated on the "Charts of Natural Oyster Bars," published by the Coast and Geodetic Survey, and is technically described and defined as follows:

Commencing at a point defined by latitude  $38^{\circ} 04' 40''.8$ , and longitude  $76^{\circ} 04' 14''.8$ , situated on line of territorial limits of county at junction of Holland and Kedge straits; thence in a straight line across waters of Chesapeake Bay to Holland Island Bar Light, the location of which is defined by latitude  $38^{\circ} 04' 07''.3$ , and longitude  $76^{\circ} 05' 45''.9$ ; thence in a straight line across waters of Chesapeake Bay to a point defined by latitude  $38^{\circ} 04' 34''.8$ , and longitude  $76^{\circ} 12' 01''.0$ , situated near the middle of Chesapeake Bay, on northwestern end of a shoal marked by a red buoy of the U. S. Light-House Establishment situated about  $5\frac{5}{8}$  miles west by north of Holland Island Bar Light,  $7\frac{1}{8}$  miles east by north of Point Lookout Light, and  $13\frac{1}{2}$  miles north of Smith Point Light; thence in a straight line with the waters of Chesapeake Bay to a point on Smith Point defined by the corner of the Maryland-Virginia boundary at the intersection of the straight line boundary across Chesapeake Bay and the low-water line of the southern shore of Potomac River; thence with the Maryland-Virginia boundary in a straight line across Chesapeake Bay to the point defined by the intersection of the boundary with the mean low-water line of the Chesapeake Bay shore of Smith Island; thence with territorial limits of county along the Chesapeake Bay shore of Smith Island and waters of entrance to Kedge Straits to point of beginning.

#### LANDMARKS (U. S. COAST AND GEODETIC SURVEY TRIANGULATION STATIONS).

##### EXPLANATION OF DESCRIPTIONS OF LANDMARKS.

The oyster laws of Maryland authorizing the surveys to be made by the Shell Fish Commission provide for "an accurate report of said survey, setting forth such a description of landmarks as may be necessary to enable the said board, or their successors, to find and ascertain the boundary lines of said natural oyster beds, bars, and rocks, as shown by delineation on the maps and charts." The law of the United States authorizing the cooperation of the Department of Commerce and Labor in the survey of natural oyster bars of Maryland provides for the erection of "such structures as may be necessary to mark the points of triangulation, so that the same may be used for such future work of the Coast and Geodetic Survey as the said Bureau may be hereafter required to perform in prosecuting the Government coast survey of the navigable waters of the United States located within the State of Maryland."

Under the provisions of the sections of the laws stated above, the markings and descriptions of landmarks must be sufficient for the present and future needs of both the Government and the State. With this end in view, considerable work has been expended in erecting permanent monuments at the triangulation stations and in the proper description of their location.

An effort has been made to arrange the descriptions of locations of landmarks in a uniform and logical manner. The descriptions start with the assumption that the individual seeking to find a landmark has only an indefinite idea of its location.

<sup>a</sup> See progress map at the end of this publication

They then gradually proceed from general descriptions of the surroundings of a landmark to the specific details of the character of the center and reference markings. An examination of the descriptions themselves will best indicate the method followed.

The heading of each description is the name by which the landmark or triangulation station is known and designated in all work and records of the Government and State.

Under the heading of "Locality" the first paragraph gives a description of the general locality of the landmark and the serial number of the published "Chart of Oyster Bars" of Maryland which best shows its location. The published charts are on the large scale of 1 part in 20,000, and show the location of the triangulation stations so clearly that in many cases the written descriptions will not be required to find them.

Under the same heading of "Locality" the second paragraph furnishes the description of the immediate locality of the landmark and refers to the bearing and distance of standard cement monument marking the reference station, as it is the first object that is likely to catch the eye when the immediate vicinity of the desired station is reached.

Under the heading of "Marks" a description is given of the character of the markings of the "observed station" and the reference station. It will be noted that, although the "observed station" is the one "occupied" and "observed on" for horizontal angles, and also the one whose geographic position is computed, frequently it is not marked as well as the reference station, and in many instances has only a pine stub to indicate its position. This is the case for the reason that the necessity of intervisibility of landmarks usually made it compulsory to locate these stations on edges of banks and ends of points of land, which in Chesapeake Bay and tributaries generally means that they will be washed away in a short period of years. The past experience of the Coast and Geodetic Survey in this region has shown the necessity of reference marks, if the frequent reestablishment of a new framework of triangulation is to be avoided.

All the marks designated in the descriptions as "the center point of triangle on standard cement monument" are exactly alike. These monuments are made of cement, sand, and gravel, and are 2 feet long and 8 inches square at top and bottom. Their tops are all marked with the same brass mold and show a center hole surrounded by a triangle, with the letters "M. S. F. C." arranged around the vertex and the letters "U. S. C. S." underneath the base of the triangle. The center hole is always in the center of the top of the monument by construction, and if this is found to have been broken off without disturbing the bottom, the center of its square section can be used as the location of the station.

All the "standard cement monuments," whether used for marking the "observed station" or "reference station," have been planted upright in exactly the same manner, with their tops projecting 3 or 4 inches above the surface of the ground.

Therefore, as the above facts in reference to the "standard cement monuments" are a constant element in all cases, the repetition of these facts in the description of stations is made needless by this one statement.

It is the expectation that the reference stations,<sup>a</sup> the character of which is explained above, will be used in many cases in the near future in the place of the "observed sta-

<sup>a</sup> To obtain the geographic positions of any of the "observed stations" or of the "reference stations," application should be made to the Superintendent of the Coast and Geodetic Survey at Washington, D. C.

tions." This has been made possible by the careful measurements of direction and distance of these stations from the "observed station," which are recorded under the heading of "References."

Under the heading of "References" are given the directions and distances of all objects that might be useful in locating the stations when the surface marks can not be found. It is also contemplated that for general purposes of topography, hydrography, or location of boundaries of oyster bars these references will be sufficient in many cases to relocate the position of an "observed station" or reference station when both of them have been destroyed.

The first reference object given in the descriptions is always a triangulation station visible from the station being described. Its direction is taken as being  $0^{\circ} 00' 00''$ , and the direction of all other objects are measured from it as an initial point, the angles being taken in a clockwise direction (left to right).

The true bearing <sup>a</sup> of the initial object is always given in parenthesis alongside the name. This furnishes means for the calculation of the bearings of any of the other reference objects for the purposes of locating a station by compass bearings or for the relocation of corner buoys of oyster-bar boundaries by the method of horizontal angles described in this publication under the heading of "Boundaries of oyster bars."

The distances in the last column under "References" are given in three different units, which vary according to their accuracy. The "miles" are statute miles and may be considered only as rough estimates. The "yards" are more accurate, but must be looked on as results generally obtained by pacing or careful estimating. The "meters," however, are accurate to the degree indicated by their decimals and in every case have been measured with a steel tape. In the same manner the accuracy of the directions are indicated by the refinement of direction with which they are recorded.

DESCRIPTIONS OF TRIANGULATION STATIONS.

SENATOR.

Locality.—Western shore of Tangier Sound, on southern side of Holland Straits and on extreme northeast point of South Marsh. (See Charts Nos. 5, 6, and 7.)

Observed station is on marsh land about 35 yards from north side and about 30 yards from east side of point. Myrtle bushes skirt shore, commencing due north, and two small pools of water are near station, one due south about 10 yards and the other southwest about 5 yards. No permanent reference points near station.

Marks.—Observed station is center point of triangle on standard cement monument.

## CRAB.

*Locality.*—Upper end and western shore of Tangier Sound on eastern side of Bloodworth Island about  $2\frac{3}{8}$  miles southeast of Sharkfin Shoal Light House and about halfway between Piney Island Cove to north and Great Cove to south. (See Chart No. 5.)

Observed station is about 15 yards from high-water mark to the northeast and about 35 yards from the shore to the east. A small flat-roof crab house stands about 80 yards to the north-northeast and another crab house about twice the distance in the same direction.

*Marks.*—Observed station is center point of triangle on standard cement monument.

*References.*—

## SHARKFIN SHOAL LIGHT.

*Locality.*—Northern end of Tangier Sound about equally distant from entrances of Hooper Strait, Fishing Bay, and Nanticoke River. (See Chart No. 5.)

*Marks.*—Observed station is center point of black lantern on hexagonal screw pile known as "Sharkfin Shoal Light."

*References.*—

## HEAD.

*Locality.*—Upper end of Tangier Sound, on southern part of peninsula known as "Bishops Head," situated between Hooper Strait and Fishing Bay. (See Chart No. 5.)

Observed station is on eastern side marsh land about  $\frac{1}{2}$  mile north of extreme southerly end of Bishops Head and about 15 yards east of two crab houses. It is about 15 yards southwest of high-water mark, behind water bushes which skirt the shore. Cement monument marking reference station is 13.41 meters west from observed station.

*Marks.*—Observed station is a nail in a pine stub flush with ground. Reference station is center point of triangle on standard cement monument.

*References.*—

## FROG.

*Locality.*—West shore of mouth of Nanticoke River, on the southeasterly point of Clay Island, known as "Frog Point." (See Chart No. 5.)

Observed station is on a marsh point about 25 yards back from extreme end of point, 20 yards from the east side and 25 yards from the west side. Water bushes abound back of station. There are no permanent reference objects near station. Cement monument marking reference station is 13.10 meters north of observed station.

*Marks.*—Observed station is nail in stub flush with ground. Reference station is center point of triangle on standard cement monument.

## COW.

*Locality.*—Western shore Nanticoke River on Mink Point about 1/4 mile east of entrance to Cow Creek. (See Chart No. 5.)

Observed station is on a very soft marsh point at the outer edge of water bushes about 5 yards back from the shore to the east, 15 yards from extreme end of point to the southeast, and 15 yards from the shore to the southwest. No permanent reference objects near station. Cement monument marking reference station is 8.68 meters northwest of observed station.

*Marks.*—Observed station is a nail in a pine stub flush with ground. Reference station is center point of triangle on standard cement monument.

## NANTICOKE CHURCH.

*Locality.*—Eastern shore of Nanticoke River in town of Nanticoke, about  $\frac{1}{4}$  mile back from river and  $\frac{3}{4}$  mile northeast of Roaring Point. (See Chart No. 5.)

*Marks.*—Observed station is center point of spire of church known as "Nanticoke Methodist Episcopal Church."

*References.*—None necessary.

## ROAR.

*Locality.*—Eastern shore of Nanticoke River on point of land known as Roaring Point, and about  $\frac{1}{4}$  mile north from outer end of Roaring Point wharf. (See Chart No. 5.)

Observed station is 30 yards to the east of the extreme end of the point and on a sandy knoll about 5 feet above high-water mark. It is about 20 yards back from high-water mark on the north side and about 40 yards back from high-water mark on south side of the point. Pine woods stand about 150 yards inshore from station.

*Marks.*—Observed station is center point of triangle on standard cement monument.

## NANTI.

*Locality.*—Eastern side of entrance to Nanticoke River about  $\frac{1}{2}$  mile northwest of Nanticoke Point. (See Chart No. 5.)

Observed station is on grassy land about 2 feet above and 20 yards back from high-water mark. It is about midway between edge of woods on Nanticoke Point and unpainted house near poplars  $\frac{1}{4}$  mile to the north.

*Marks.*—Observed station is center point of triangle on standard cement monument.

WHITE.

*Locality.*—Eastern shore of entrance to Nanticoke River on western part of Nanticoke Point. (See Chart No. 5.)

Observed station is on a sand and grass point about 2 feet above high-water mark, 3 yards from the west side, 15 yards from the south end, and 20 yards from southeast side. Dense pine woods stand about 100 yards to the northwest, open marsh to the northeast, and a clump of about a dozen pine trees in marsh about ¾ mile to the northeast. There is a cove about 40 yards east of the station and another point of land about 100 yards to the southeast. Cement monument marking reference station is 16.63 meters north of observed station.

*Marks.*—Observed station is a nail in a pine stub about 6 inches below surface of ground. Reference station is center point of triangle on standard cement monument.

CHILD.

*Locality.*—North shore of Wicomico River about  $\frac{3}{8}$  mile north of Mount Vernon Church. (See Chart No. 5.)

Observed station is on marsh land about 2 feet above and 15 yards back from high-water mark. There is an old wharf about 300 yards to the east and at a point about 100 yards to the north, two creeks join and form a single creek about 20 feet wide which flows into the river at a point about 15 yards west of observed station.

*Marks.*—Observed station is center point of triangle on standard cement monument.

CREEK.

*Locality.*—North shore of Wicomico River, about  $\frac{3}{4}$  mile northwest of Mount Vernon wharf and about  $1\frac{1}{8}$  miles northeast of Mount Vernon Church. (See Chart No. 5.)

Observed station is on a marsh grass and sand point making out to the south and about 10 yards from the high-water mark of each of the three sides of the point. About 10 yards west of observed station is the mouth of a creek or drain 10 feet wide which runs only a short distance inland. There are several unpainted houses within 200 yards of observed station and a lone pear tree stands about 200

yards to the north. There is a cultivated field about 150 yards back of station which extends to edge of woods  $\frac{1}{4}$  mile distant.

Marks.—Observed station is center point of triangle on standard cement monument.

## JONES.

*Locality.*—South shore of Wicomico River about  $\frac{3}{4}$  mile west of Mount Vernon wharf. (See Chart No. 5.)

Observed station is on a knoll about 25 feet above and 30 yards to south of high-water mark, and about 200 yards to the east of a cove. The knoll on which the station is located is the highest point on the shore in this locality. Several small cabins stand to the northward about 25 yards, and a large lone cedar tree about 35 yards to the southwest.

*Marks.*—Observed station is center point of triangle on standard cement monument.

## IVEE.

*Locality.*—Southeast shore of Wicomico River about  $\frac{1}{4}$  mile northwest of Mount Vernon Church (See Chart No. 5.)

Observed station is on grass land about 1 foot above and 10 feet back from high-water mark. A small cove makes in about 100 yards east of station. A small lone pine stands about 110 yards to the east-southeast, and a sand bluff with pine trees about 100 yards to the southwest. Beyond the woods along the beach is a bluff 15 feet high upon which are several houses.

*Marks.*—Observed station is center point of triangle on standard cement monument.

MOUNT VERNON CHURCH.

*Locality.*—Southeast side of Wicomico River about  $\frac{3}{8}$  mile back from the shore  $1\frac{1}{2}$  miles south-west of Mount Vernon wharf. (See Chart No. 5.)

Observed station is on main road in Mount Vernon and is situated on the highest point in the vicinity.

*Marks.*—Observed station is center of steeple of Mount Vernon Methodist Church.

*References.*—None necessary.

BALL.

*Locality.*—Southeast shore of Wicomico River on a point of land about 1 mile northeast of Wingate Point. (See Chart No. 5.)

Observed station is on a sand and grass point making out about 100 yards west of a sand bluff. A small creek empties into the river about 10 yards to the east, and three poplars stand about 100 yards to the south. The extreme northern end of the point is about 35 yards from station and the western side is about 10 yards.

*Marks.*—Observed station is center point of triangle on standard cement monument

## DOVE.

Locality.—South shore of Monie Bay and about ¼ mile east of entrance to Pigeon Creek. (See Chart No. 5.)

Observed station is on marsh land about 10 yards back from high-water mark not far from water bushes which stand to the east. Cement monument marking reference station is 13.98 meters southeast from observed station. No permanent reference objects near station.

Marks.—Observed station is a nail in pine stub flush with ground. Reference station is center point of triangle on standard cement monument.

## GREAT SHOALS LIGHT.

Locality.—Middle of entrances to Monie Bay and Wicomico River about halfway between Long Point to the south and Mollies Point to the north. (See Chart No. 5.)

Marks.—Observed station is center of black lantern on square screw pile structure known as "Great Shoals Light."

References.—	°	'	"	
"Sharkfin Shoal Light" (S 81° 50' W).....	00	00	00	5¾ miles.

## SHORT.

*Locality.*—Southern shore of entrances to Monie Bay and Wicomico River on Long Point and about 1 mile south-southwest from Great Shoals Light. (See Chart No. 5.)

Observed station is on a sandy knoll on eastern side of entrance to Dames Quarter Creek about 15 feet back from high-water mark on the north side and about 30 feet from east side of point. It is on the highest part of the knoll which is about 5 feet above high-water mark.

*Marks.*—Observed station is center point of triangle on standard cement monument.

## ROOM.

*Locality.*—Upper end and eastern shore of Tangier Sound on Halls Point. (See Chart No. 5.)

Observed station is on a bluff 15 feet high about 5 yards back from its edge. It is about 25 yards east of a clump of mulberry trees and about 15 yards north-northwest of a barn. Locust and mulberry trees stand all about station and locust bushes along the edge of the bluff. A wagon trail runs parallel to the shore about 15 yards back of station. Cement monument marking reference station is 21.45 meters south-southwest of observed station and almost in line with a large mulberry tree.

*Marks.*—Observed station is nail in center of stub with top flush with ground. Reference station is center point of triangle on standard cement monument.

*References.*—

## HAINES.

*Locality.*—Upper end and eastern shore of Tangier Sound on Haines Point, about  $\frac{5}{8}$  mile north of Deal Island Wharf. (See Chart No. 5.)

Observed station is on sand and grass point about 20 yards back and 5 feet above high-water mark. Locust and water bushes stand about 20 yards to the north and the left edge of this clump is about on

line with Sharkfin Shoal Light. A barbwire fence runs 3 yards east of station. Cement monument marking reference station is 9.64 meters east of observed station.

*Marks.*—Observed station is nail in pine stub in center of a drain tile with top broken off below surface. Reference station is center point of triangle on standard cement monument.

#### DEAL ISLAND CHURCH.

*Locality.*—Deal Island on main road about ¼ mile from the shore and about ¾ mile south of Laws Thoroughfare. (See Chart No. 5.)

*Marks.*—Observed station is center of steeple on Deal Island Methodist Church.

*References.*—None necessary.

#### BAR.

*Locality.*—Eastern shore of Tangier Sound on western side of Deal Island, about 1 mile northwest of entrance to Lower Thoroughfare and ½ mile south of Middle Creek. (See Charts Nos. 5 and 7.)

Observed station is about 10 yards east of high-water mark on sand and grass land back of sandy beach. The first of many tree stumps which are submerged at high water commence about 100 yards to the north and cat-tails grow abundantly back of station. Cement monument marking reference station is 6.09 meters east of observed station.

*Marks.*—Observed station is a nail in pine stub flush with ground. Reference station is center point of triangle on standard cement monument.

## SANDY.

*Locality.*—Northern shore of Manokin River on point of land known as Sandy Point opposite Fishing Island. (See Charts Nos. 5 and 7.)

Observed station is on a sandy point about 5 feet above and 10 yards back from high-water mark on south side of point and about 75 yards from high-water mark on west side. A sandy beach is building out to southward and a heavy clump of myrtle bushes extends from a point about 25 yards west to a point about 75 yards west.

*Marks.*—Observed station is center point of triangle on standard cement monument.

"Solomons Lump Light" (S 72° 06' E).....	00	00	00	4 $\frac{3}{4}$ miles.

## SOLOMONS LUMP LIGHT.

*Locality.*—Kedge Straits about  $\frac{1}{2}$  mile north of Smith Island and about 1 $\frac{1}{2}$  miles south of South Marsh. (See Charts Nos. 6 and 7.)

*Marks.*—Observed station is center of black lantern on square tower on northerly side of a caisson and octagonal structure known as "Solomons Lump Light."

*References.*—

	o	'	"	
"Janes Island Light" (S 42° 12' E).....	00	00	00	7 $\frac{3}{8}$ miles.

## FOG.

*Locality.*—Eastern shore of Chesapeake Bay and southern shore of Kedge Straits on northwest point of Smith Island known as "Fog Point." (See Chart No. 6.)

Observed station is on the north side of a sand and grass point about 1 foot above high-water and about 65 yards from extreme end of point to northeast and 6 yards south-southeast from shore. The

## Survey of Oyster Bars, Somerset County, Md.

remains of old "Fog Point Light House" are about 50 yards to west-southwest, and myrtle bushes abound on all sides except on the west side, which is a sandy beach. Cement monument marking reference station is 15.26 meters south from observed station and about in line with a lone cherry tree  $\frac{1}{4}$  mile distant.

*Marks.*—Observed station is nail in center of tile pipe with top flush with surface of ground. Reference station is center point of triangle on standard cement monument.

## JOSEPH.

*Locality.*—Eastern shore of Chesapeake Bay and western side of Smith Island, about 3 miles southwest from Solomons Lump Light and about  $\frac{1}{2}$  mile north of entrance to Smith Island Thoroughfare (See Charts Nos. 6 and 8.)

Observed station is on marsh land about 30 yards back from edge of sandy shore. There is nothing but marsh grass for  $\frac{1}{4}$  mile on all sides except a slough about 30 yards wide, which begins about 60 yards southeast of observed station and runs south to Smith Island Thoroughfare. Cement monument marking reference station is 38.74 meters northeast of station and is nearly on line with Solomons Lump Light.

*Marks.*—Observed station is nail in stub flush with ground. Reference station is center point of triangle on standard cement monument.

One pine tree.....	330	27		4¼ miles.

JOSHUA.

*Locality.*—Eastern shore of Tangier Sound on western side of Little Island, about ⅓ mile southeast from extreme eastern point of island. (See Chart No. 7.)

Observed station is on northern half of a sand dune about 10 feet above and 20 feet back from high-water mark. The southern half of the sand dune is covered with bushes and scrub trees. A large aspen tree stands about ¼ mile north of the station. Cement monument marking reference station is located on low land 32.06 meters north of observed station, and is nearly on line with large aspen tree.

*Marks.*—Observed station is a nail in pine stub flush with ground and is likely to be disturbed by shifting of sand dune. Reference station is center point of triangle on standard cement monument.

KELLEY.

*Locality.*—Northern shore of Manokin River on Kelley Island, which is located off point between Fishing Creek and Laws Thoroughfare just inside of entrance to Laws Thoroughfare. (See Chart No. 7.)

Observed station is on a small point making off southern side of a marsh island known as "Kelley Island." It is about 8 yards from the east side and about 12 yards from west side of point. Myrtle bushes grow about 5 yards to west and north of observed station and a crab shanty stands on northern end of island about 100 yards north from station. Cement monument marking reference station is 10.44 meters northeast of observed station.

*Marks.*—Observed station is center of a square wooden box with top just above ground. Reference station is center point of triangle on standard cement monument.

*References.*—

## ST. PIERRE.

*Locality.*—Manokin River on a small marsh island known as "St. Pierre Island." (See Chart No. 7.)

Observed station is on west side of island about 20 yards from the shore to the west and about 30 yards from the shore to the south. A clump of myrtle bushes stand about 15 yards northwest of station, and the shore of a small bay is about 30 yards to the east. Cement monument marking reference station is 7.97 meters east-southeast of observed station and on line to "Fairmount Church."

*Marks.*—Observed station is a nail in pine stub in center of square wooden box. Reference station is center point of triangle on standard cement monument.

## FITZ.

*Locality.*—Northwestern shore of upper Manokin River, about 1 mile northeast from Locust Point. (See Progress Map.)

Observed station is on the edge of the lawn of a large old red brick house owned by Mr. Fitzgerald, about 4 yards west of shore and 23 yards southwest of extreme end of point. Four locust trees, each 8 inches in diameter, stand back of station, and there is a cobblestone about 12 inches in diameter about 2 yards to the east. There is a small pond 20 yards to the north of the station.

*Marks.*—Observed station is center point of triangle on standard cement monument.

## PEN.

*Locality.*—Southeastern shore of upper Manokin River on Clifton Point. (See Progress Map.)

Observed station is northern chimney of a large 2 1/2 story, 4-gable roof, brick house belonging to Mr. Pendelton. The house is back from the river, and there are trees between it and the shore.

*Marks.*—Observed station is center of northern chimney on house belonging to Mr. Pendelton.

*References.*—None necessary.

## COX.

*Locality.*—Eastern shore of upper Manokin River on marsh point about 3/4 mile north of entrance to Back Creek. (See Chart No. 7.)

Observed station is about 15 yards east and 10 yards south of high-water mark. A small building stands in the water about 20 feet from bank to the northeast of station, and Bennett's oyster watch-house is about 15 yards east of station.

*Survey of Oyster Bars, Somerset County, Md.*

*Marks.*—Observed station is center point of triangle on standard cement monument.

GREEN.

*Locality.*—Upper Manokin River on eastern shore about ¼ mile north of entrance to Back Creek. (See Chart No. 7.)

Observed station is on grassy land about 10 yards east of a sandy beach adjoining a marsh point, and is about 3 yards north of curve in road. Two small locust trees stand about 3 yards distant, one to the northwest and the other to the east of station. A cedar tree 10 inches in diameter stands about 10 yards to the south.

*Marks.*—Observed station is center point of triangle on standard cement monument.

BARN.

*Locality.*—South shore of Manokin River on prominent point of land between Wolf Trap and Back creeks. (See Chart No. 7.)

*Marks.*—Observed station is center point of cupola on a large red frame structure used as a barn on farm of Hershel Ford.

*References.*—None necessary.

CUPOLA.

*Locality.*—South shore of Manokin River on north end of Fishing Island. (See Chart No. 7.)

*Marks.*—Observed station is center point of top of bell cupola on Bennett's oyster house.

*References.*—None necessary.

STAFF.

*Locality.*—Southern shore of Manokin River on eastern side of entrance to Broad Creek, about ¼ mile southeast of Cormal Point. (See Chart No. 7.)

*Marks.*—Observed station is flagstaff on eastern end of roof of oyster house on Cox's wharf.

*References.*—None necessary.

FAIRMOUNT CHURCH.

*Locality.*—Town of Upper Fairmount about halfway between Manokin and Big Annemessex rivers. (See Chart No. 7.)

*Marks.*—Observed station is center point of steeple on Fairmount Methodist Church.

*References.*—None necessary.

## PRICKLY.

*Locality.*—Eastern shore of Tangier Sound and southeastern side of entrance to Manokin River on a small point  $\frac{1}{4}$  mile south of Prickly Point. (See Chart No. 7.)

Observed station is on a sandy spot about 5 feet above and 30 yards back from high-water mark on west side and about 35 yards from end of point to northwest. About 10 feet southeast of station is a clump of myrtle bushes, and 7 to 18 yards back of these is a small group of pine trees.

*Marks.*—Observed station is center point of triangle on standard cement monument.

*References.*—

## HAS.

*Locality.*—Eastern shore of Tangier Sound on point at north side of entrance to Big Annemessex River about halfway between Porpoise Point and Two Mouth Creek. (See Chart No. 7.)

Observed station is on a sand dune about 10 feet above and 30 yards back from high-water mark to the west. A pool averaging 40 feet by 100 feet stands 50 feet east of observed station. Cement monument marking reference station is 5.21 meters east of observed station and about on line to Fords wharf.

*Marks.*—Observed station is a nail in a pine stub with top flush with ground. Reference station is center point of triangle on standard cement monument.

*References.*—

## FORD.

*Locality.*—North shore of Big Annemessex River on south side of Jerico Marshes just east of Muddy Creek. (See Chart No. 7.)

Observed station is chimney on roof of oyster house near Fords wharf. Chimney is a little east of middle of roof.

*Marks.*—Observed station is center of chimney on roof of oyster house.

*References.*—None necessary.

## MOON.

*Locality.*—North shore of Big Annemessex River on point between Moon Bay and Crane Cove. (See Chart No. 7.)

Observed station is on a marsh point about 35 yards from extreme end, 25 yards from east side and 30 yards from south side. A small pool stands about 10 yards south of observed station and a crescent-shaped pool about 10 feet wide and 100 feet long extends from a point about 20 yards west to a point about 20 yards north of station. A row of small myrtle bushes begins at a point directly south of

observed station, extends along shore toward the east, and ends at Moon Bay. Another lot of small myrtle bushes begins at a point about 100 yards west of observed station and extends along the shore to the west. There are no other points of reference near station.

*Marks.*—Observed station is center point of triangle on standard cement monument.

#### COLBURN.

*Locality.*—South shore of Big Annesmessex River on southeastern side of entrance to Colburn Creek (See Chart No. 7.)

Observed station is chimney on top of a modern several gable house. House sets alone about halfway between oyster houses to the west and a group of houses to the east.

*Marks.*—Observed station is center of chimney on top of modern several gabled house.

*References.*—None necessary.

#### GEOG.

*Locality.*—South shore of Big Annesmessex River on point on east side of a square-shaped inlet about ¾ mile northeast of the entrance to Jones Creek. (See Chart No. 7.)

Observed station is on marsh land about 50 yards back from extreme end of point, about 20 yards from southeast corner of square-shaped bay and about 25 yards from east shore line. Myrtle bushes extend along shore to the east of station for about 100 yards, and reeds grow 25 yards to the north.

*Marks.*—Observed station is center point of triangle on standard cement monument.

#### FLAT CAP.

*Locality.*—Eastern shore of Tangier Sound and about ½ mile south of Flat Cap Point on south side of entrance to Big Annesmessex River. (See Chart No. 7.)

Observed station is on a sand dune about 10 yards back and 10 feet above high-water mark. A sandy beach extends along shore for about 100 yards in both directions and remainder of land is grassy. A slough begins at a point about 50 yards southeast of observed station and extends south. Cement monument marking reference station is 13.64 meters east of observed station.

*Marks.*—Observed station is a 1½-inch iron pipe with top flush with the surface of the ground. Reference station is center point of triangle on standard cement monument.

NORTH CHURCH (SMITH ISLAND).

*Locality.*—In town of Ewell on group of marsh islands known as "Smith Island." (See Chart No. 8.)

Observed station is on solid land on south shore of Smith Island Thoroughfare about 1 mile from the eastern shore of Chesapeake Bay.

*Marks.*—Observed station is center point of spire of church known as "Corinth Methodist Episcopal Church."

*References.*—None necessary.

OLD CHURCH (SMITH ISLAND).

*Locality.*—Western side of the group of marsh islands known as "Smith Island" on solid land about ⅜ mile from the eastern shore of Chesapeake Bay and ⅓ mile east of upper end of Shanks Creek at Rhodes Point. (See Chart No. 8.)

*Marks.*—Observed station is center point of spire of church known as "Calvary Methodist Episcopal Church."

*References.*—None necessary.

EWELL CHURCH (SMITH ISLAND).

*Locality.*—In town of Tylerton near the center of the group of marsh islands known as "Smith Island" on solid land about ⅓ mile east of the narrowest part of waters joining Tylers Creek and Tylers Ditch. (See Chart No. 8.)

*Marks.*—Observed station is center point of spire of church known as "Union Methodist Episcopal Church."

*References.*—None necessary.

SHANKS HAMMOCK.

*Locality.*—Eastern shore of Chesapeake Bay on Shanks Island, which is located in Virginia about ¾ mile east of the southern end of Smith Island. (See Chart No. 8.)

Observed station is on the northeast side of the island, on low ground about ½ mile from its northern end about 70 yards back from shore and 110 yards from end of point to east. It is near the southern extremity of a hummock covered with a dense growth of scrub trees and bushes and is about 35 yards north of a pile of brick, the ruins of a house. Cement monument marking reference station is 1.43 meters southwest of observed station.

*Marks.*—Observed station is center of a 4-inch tile pipe with top just below the surface of the ground. Reference station is center point of triangle on standard cement monument.

## REACH HAMMOCK.

*Locality.*—South end and eastern side of Tangier Sound on Reach Hammock Island, which is located between Smith and Tangier islands about 1 mile east of Fishbone Island. (See Chart No. 9.)

Observed station is on the northeastern end of a small marshy island known as Reach Hammock and is about 5 feet from the present shore line, which is rapidly washing away. It is close to a small fish fertilizer factory which stands on the island. Cement monument marking reference station is 9.10 meters east by south of observed station.

*Marks.*—Observed station is the center of a 6-inch tile pipe with top flush with surface of the ground. Reference station is center point of triangle on standard cement monument.

## FISHBONE.

*Locality.*—Dividing waters of Chesapeake Bay and Tangier Sound on western side of Fishbone Island, which is located between Smith and Tangier islands. (See Chart No. 9.)

Observed station is on marsh ground about 15 yards from shore to the west and about halfway between northern and southern extremities of island. The station is about level with high-water mark, but there is a slight elevation between station and shore and a small shanty stands about 20 yards to the southwest. Cement monument marking reference station is 10.08 meters south of observed station and about on line with shanty.

*Marks.*—Observed station is a nail in stub flush with surface of ground. Reference station is center point of triangle on standard cement monument.

*Marks.*—Observed station is center of steeple on church known as "Emmanuel Methodist Episcopal Church."

*References.*—None necessary.

MOUNT PLEASANT CHURCH.

*Locality.*—City of Crisfield, about 1 mile from Crisfield Harbor. (See Chart No. 9.)

*Marks.*—Observed station is center of steeple on brick church on Main street known as "Mount Pleasant Methodist Protestant Church."

*References.*—None necessary.

ASBURY CHURCH.

*Locality.*—In town of Lawsonia, about 1½ miles from Crisfield Harbor. (See Chart No. 9.)

*Marks.*—Observed station is center of very slender steeple on church known as "Asbury Methodist Episcopal Church."

*References.*—None necessary.

## BEACON.

*Locality.*—Between Tangier and Pocomoke sounds, on small island just north of Great Fox Island known as "House Island." (See Chart No. 9.)

Observed station is about 100 yards south of extreme northern shore and about 30 yards from west shore of island. The shore of an inlet which makes into eastern side of island is about 15 feet northwest of observed station. Cement monument marking reference station is 4.12 meters west of observed station. A temporary wooden beacon stands 0.40 meters south of observed station.

*Marks.*—Observed station is center of a 6-inch tile pipe set in cement and projecting above ground about 6 inches. Reference station is center point of triangle on standard cement monument.

*NOTE.*—What was taken to be center mark of old "Beacon" of 1898 is a 2-inch iron pipe projecting above ground with three stubs projecting 3 feet above ground which were apparently used to support instrument. Wooden sills supported by 10-inch piles form a square with the 2-inch pipe in center.

## FOX ISLAND POPLAR.

*Locality.*—Eastern shore of lower Tangier Sound on western side of Great Fox Island about half-way between the northern and southern ends of the island. (See Chart No. 9.)

Observed station is a very prominent lone Lombardy poplar situated on solid land about ⅓ mile inshore from Tangier Sound.

*Marks.*—Observed station is center of a lone Lombardy poplar tree.

*References.*—None necessary.

## SAM.

*Locality.*—Western end and northern shore of Pocomoke Sound on north side of the entrance to Cedar Straits about ⅓ mile north of Green Harbor Island. (See Chart No. 9.)

Observed station is on marsh land between two clumps of water bushes about 10 yards back from extreme high-water mark and 15 yards back from ordinary high-water mark. A slough passes about 100 yards north of station and there are several pools 50 yards north of station. Cement monument marking reference station is 2.81 meters north of observed station. "Watkins Point" of the Maryland-Virginia boundary is in the water between "Sam" and Green Harbor Island.

*Marks.*—Observed station is center of iron pipe projecting 4 inches above ground. Reference station is center point of triangle on standard cement monument.

WATERMELON HUMMOCK.

Locality.—Northern shore of Pocomoke Sound in midst of a large tract of marsh land lying between Apes Hole Creek and Broad Creek about 2½ miles southeast of Somers Cove Light. (See Chart No. 9.)

Observed station is in midst of marsh near a clump of trees which stand about 25 yards to the north. It is about 150 yards southwest of a wide part of the upper end of Massey Creek.

Marks.—Observed station is center point of triangle on standard cement monument.

EAST.

Locality.—North shore of Pocomoke Sound between Apes Hole and Broad creeks on a detached marsh point on east side of entrance to Cow Gap Creek. (See Chart No. 9.)

Observed station is on southerly part of a small marsh island separated about 200 yards from point of mainland. Water bushes cover northerly part of the island. Observed station is about 13 yards south of shore, 14 yards west of shore, 36 yards north of shore, and 5 yards east of shore. Cement monument marking reference station is 6.38 meters southeast of observed station.

Marks.—Observed station is a spike in a cement filled tile pipe with top even with surface of marsh. Reference station is center point of triangle on standard cement monument.

## MONKEY.

*Locality.*—North side of Pocomoke Sound on a small island known as "Watkins Island" off entrance to Apes Hole Creek. (See Chart No. 9.)

Observed station is in the middle of a small islet about 12 yards by 4 yards which is covered with marsh grass and awash at high water. It is very solid ground on top but soft beneath and island will probably be washed away in a few years.

*Marks.*—Observed station is center point of triangle on standard cement monument.

## SCOT.

*Locality.*—North shore of Pocomoke Sound on extreme southern point of marsh land between East and Marumscoc creeks. (See Chart No. 10.)

Observed station is on a marsh point about 25 yards back from extreme end of point, 30 yards back from west side of point, and 20 yards from south side. It is surrounded by a thick and high clump of water bushes which extend along the shore to the eastward. There are no permanent reference objects near station. Cement monument marking reference station is 11.66 meters northeast of observed station.

*Marks.*—Observed station is an inverted spike in cement which is flush with ground and covers the top of a 6-inch tile pipe. Reference station is center point of triangle on standard cement monument.

## OLD.

*Locality.*—North shore of Upper Pocomoke Sound on point of land halfway between Marumscoc Creek (called "Old Johns Creek" on navigation charts) and Williams Point. (See Chart No. 10.)

Observed station is about 150 yards east of John T. Handy's wharf and about 15 feet back. It is on a narrow strip of marsh land which is wearing away by wave action, and thick water bushes stand east and west of station. Three large pine trees stand about ⅓ mile north by east and several oyster houses about 200 yards to the west. Cement monument marking reference station is 11.57 meters north by east of observed station and about on line with largest of three large pines mentioned above.

*Marks.*—Observed station is spike in cement which is flush with ground and covers the top of a 6-inch tile pipe. Reference station is center point of triangle on standard cement monument.

WILL.

Locality.—North shore of Pocomoke River on peninsula known as "Williams Point." (See Chart No. 10.)

Observed station is on the highest part of Williams Point about ⅜ mile north of extreme southern end of point and well back from both shores. A clump of bushes and two small cedar trees stand about 40 yards to the north and two medium-sized cedar trees about 300 yards to the west. A drainage creek with mouth on easterly side of peninsula runs almost completely around observed station, passing about 50 feet to the south.

Marks.—Observed station is center point of triangle on standard cement monument.

CUP.

Locality.—Virginia side of Pocomoke River on solid land about ¼ mile back from shore and ⅓ mile from nearest bend of Holden Creek. (See Chart No. 10.)

Observed station is octagonal cupola on unpainted barn on land known as "Jolly's Neck Farm." Barn stands near many cedar trees and south of another large unpainted building.

Marks.—Observed station is center point of top of cupola on barn.

References.—None necessary.

SUMMER.

Locality.—South and Virginia shore of mouth of Pocomoke River about ¾ mile south of Williams Point, on point known locally as "Sand Bar Point." (See Chart No. 10.)

Observed station is on sandy part of marsh land about 20 feet back from high-water mark on north and west sides of point. There are no permanent reference marks near station.

Marks.—Observed station is center point of triangle on standard cement monument.

OIL.

*Locality.*—South and Virginia shore of upper end of Pocomoke Sound on a point of land known as "Pig Point," located about 1½ miles southwest of Williams Point. (See Chart No. 10.)

Observed station is on western side of a marsh point covered with sand about 2 feet above and 30 feet east of ordinary high-water mark, 5 feet east of extreme high-water mark, 100 feet south of ordinary high-water mark, and about 3 feet south of extreme high-water mark. Water bushes skirt shore to east and north and sand beach curves to southwest. On next point about ¼ mile southwest are two trees. Cement monument marking reference station is 46.18 meters south of observed station.

*Marks.*—Observed station is spike in center of 6-inch tile pipe filled with cement with top flush with surface. Reference station is center of triangle on standard cement monument.

SAXIS CHURCH.

*Locality.*—Southeast and Virginia shore of Pocomoke Sound on solid land known as "Saxis Island" about 3¼ miles from shore of sound and ½ mile northeast of mouth of Starling Creek. (See Chart No. 10.)

*Marks.*—Observed station is center point of spire on church known as Southern Methodist Episcopal Church.

*References.*—None necessary.

MOS.

*Locality.*—Eastern extremity of marsh land between Pocomoke Sound and Messongo Creek on a point of land locally called "Fishing Point." (See Chart No. 10.)

Observed station is on the western extremity of marsh point and about 1⁄8 mile east of the eastern extremity of a small island. It is about 2 feet above and 8 feet back from ordinary high-water on north

side and 45 feet from western end of point. A crab-packing shanty stands about 8 yards to eastward of observed station.

Marks.—Observed station is center point of triangle on standard cement monument.

### BOUNDARIES OF OYSTER BARS.

#### EXPLANATION OF DESCRIPTIONS OF BOUNDARIES.

The oyster bars of Somerset County are 37 in number, and their total area, as marked out by buoys placed by the hydrographic engineer of the Commission, is 27,566 acres. As provided by law, the boundaries of the oyster bars are all straight lines, but they inclose areas of all shapes from triangles to complicated fourteen-sided figures, and of all sizes from 3,083 acres to 10 acres.<sup>a</sup> The sides vary in length from 130 to 6,800 yards, and in some cases the corners of the boundaries are practically at the triangulation stations from which they are located, while in other instances they are over 13,600 yards from the landmarks most available for the purpose of fixing their positions.

The varied characteristics of the legal boundaries of the oyster bars indicated by the above statement, together with the complicated requirements of the law under which the survey has been made, and the magnitude of the work, with the consequent need of fixed and uniform methods, has made the problem of describing the boundaries one of considerable difficulty and importance.

The boundaries of the oyster bars of Maryland, as established by the Shell Fish Commission and delineated on the Coast and Geodetic Survey charts and projections and on the leasing charts of the Commission, are technically defined and described by a method somewhat different from that used in other oyster surveys. But it is believed that the forms finally adopted will fulfill all needs of the survey for both the present and future.

The descriptions have been arranged in tabular form, thus avoiding many hundred repetitions of the same words by making one explanation of the tables sufficient for all oyster bars in the county.

At the top of each tabular form is given the legal name of the oyster bar to be described, its general locality, and the serial number of the "Charts of Oyster Bars" of Maryland on which its legal boundaries are shown.

The first column, under the heading of "Corner of bar," gives the number corresponding to the corner of the boundary as shown on the charts and to the number on the buoy marking the actual corner of the bar. The numbers of the corners have been assigned by naming the southernmost point No. 1, thence proceeding in a clockwise direction around the bar; but where a corner of one oyster bar is identical with the

<sup>a</sup> For similar statistics for other counties that have been surveyed, see Appendix C of this publication.

corner of the boundaries of one or more other oyster bars, crab bottoms, or clam beds, only the number of the corner of the oyster bar being described in the table is given in this column.

The second and third columns, under the headings of "Latitude" and "Longitude," give the geographic positions of the corners. These positions have been adopted by the Commission as the primary technical definition of the corners, and should be considered as final in case of a dispute arising from discrepancies caused by other means of location. The latitudes and longitudes given in these columns are based on the United States standard datum of the Coast and Geodetic Survey, and the points thus defined can be relocated from distant triangulation stations of the Survey, even though all the landmarks and buoys originally used for their location have been destroyed by natural causes or by acts of vandals desiring to defeat the purposes of the oyster laws of Maryland.

The fourth and fifth columns, under the general heading of "True bearing"<sup>a</sup> and the specific headings "Forward" and "Back," give bearings measured from a true north-and-south line. The three "Forward" bearings are from the corner of the boundary designated in the first column to the triangulation stations named on the corresponding lines in the last column, and the three "Back" bearings are from these same stations in the last column to the corresponding corner of boundary in the first column. The difference in minutes of arc between the forward and back bearings shown in some cases is actual and not accidental, and is due to the fact that the computations took into account the spheroidal shape of the earth.

The sixth column, under the heading of "Distance," gives the three computed distances in yards from the corner of the bar noted in the first column to the three triangulation stations named on the corresponding lines in the last column, and vice versa.

The seventh and last column, under the heading of "U. S. C. & G. S. triangulation station,"<sup>b</sup> gives the names of the landmarks from which were computed the corresponding "Latitude," "Longitude," "True bearing," and "Distance" of the "Corner of the bar" designated in the first column. A full description of the location and markings of these triangulation stations is given in another part of this publication, under the heading of "Description of triangulation stations."

#### SURVEYING METHODS FOR RELOCATION OF BOUNDARIES.

There are a number of methods that can be used in the relocation of the actual boundaries of the natural oyster bars as technically described in this publication and delineated on the published charts of the Coast and Geodetic Survey and the leasing charts of the Shell Fish Commission.

The following brief descriptions of five of these more or less different methods assume a certain amount of experience and knowledge on the part of the engineer in the particular kind of surveying under consideration, and are only intended as reminders of ways and means that can be used.

There are two problems that are likely to present themselves to those interested in the boundaries of natural oyster bars. One, to determine whether the buoys marking

<sup>a</sup> The mean magnetic variation of Somerset County for 1908 was 5° 30' west of north, and increasing at the rate of 3' yearly.

<sup>b</sup> Geographic positions of these triangulation stations can be obtained by application to the Superintendent of the Coast and Geodetic Survey at Washington.

the corners have been dragged or otherwise moved from their correct positions, and the other, to relocate or reestablish a buoy at the point from which it was removed. The different ways of solving these two problems partly depend upon the instruments possessed by the engineer and his assistants and partly on his training and experience.

(1) *Triangulation*.—This method is the one that will give the greatest accuracy, but on account of its requiring special data and instruments, and being an operation rarely used by engineers not engaged in geodetic surveying, it is recommended only for cases in dispute that can not be settled satisfactorily by some other method. An explanation of this class of work would be too long for a report of this sort, and those not familiar with this method are referred to the publications on the subject by the Coast and Geodetic Survey.

(2) *Hydrographic*.—This method is the most simple and satisfactory one that can be adopted if the surveyor can obtain the use of the necessary instruments and assistants. It is the one best suited for the work of the engineers of the Commission in relocating corners of boundaries, as it gives results of the accuracy ordinarily required and is rapid in execution. Besides, it has the advantage of being available whenever three triangulation stations of suitable relative positions are visible from the offshore points needing relocation.

Most navigators and others familiar with the use of a sextant are well acquainted with the graphic three-point method of fixing a position on water, and only a brief description of the operation will be stated.

In the case where there is only one engineer, having a single sextant, the three-point method can be used, but not until the two angles determining the position of any buoy have been derived from the "Forward bearing" given in the tabular forms describing the boundaries of the oyster bars. For example, take "Turtle Egg Island" bar, which is the first one described in this publication, and assume that "Corner No. 3," is to be examined as to its position. The angle between the two landmarks "Senator" and "Deal Island Church" as determined from right to left from the forward bearings from this corner is  $128^{\circ} 39'$  and the angle between "Deal Island Church" and "Crab" is  $99^{\circ} 30'$ . Having these two angles, the engineer proceeds to the buoy of doubtful location and measures the actual sextant angles between the landmarks for which the calculations were made. If the measured and calculated angles do not agree the buoy is not in its correct position and the boundary corner must be relocated. This is accomplished by moving the boat about until a point is reached where angles do agree, and this point being the desired location, the buoy can be placed in its correct position.

If the engineer can obtain the use of both a sextant and a three-arm protractor ("position finder"), the availability of the hydrographic method is increased, as the use of the protractor is essential in case of the washing away or destruction of one or more of the landmarks originally used in describing the boundaries. Under these circumstances, any three landmarks of suitable relative positions that are visible from the point to be located can be utilized. For example, the engineer can proceed to the buoy of doubtful position and measure the two adjacent sextant angles between the three landmarks selected. These two angles are set off on the three-arm protractor and the actual position of the buoy plotted on the chart by shifting the protractor about until the edge of each of the three arms passes through the center of the symbols on the

chart marking the position of the three landmarks selected. The center of the hub of the protractor will indicate on the chart the actual position of the buoy, and if the point thus obtained does not coincide with the true position of the corner of the boundary as given on the chart, the surveyor can proceed to locate the buoy correctly by reversing the operation. This is done by placing the center point of the hub of the protractor over the corner of the boundary in question and measuring on the chart the two adjacent protractor angles between the three selected landmarks. One of the angles thus obtained is set on the sextant and the boat moved about until the two landmarks are shown by the sextant to subtend the same angle obtained from the protractor. The second angle is then placed on the sextant and the same operation gone through, and so on, first using one angle on the sextant then the other until a point is reached where both observed sextant angles are practically identical with the protractor angles. The point thus located is the desired one and the buoy can be placed to mark the true position of the corner of the boundary in question.

If the engineer possesses two sextants and a protractor, this problem is far easier of solution, as the two angles can be set off on separate sextants and the observer can quickly find the desired point where they agree with the protractor angles by using one sextant after the other without the need of resetting either.

If there are two observers, two sextants, and a protractor, it can be seen that the best conditions for both rapid and accurate hydrographic locations of points are attained; in fact, this is the method by which the buoys at the corners of the boundaries were originally placed by the hydrographic engineer to the Commission.

(3) *Magnetic bearings from offshore.*—This method of fixing a position on water is a simple and well-known one in navigation. It is available to anyone having a boat compass and will be of special use to the State fishery force in investigating cases where buoys are supposed to have been moved for illegal purposes.

In the case where a buoy is supposed to have been moved from its true position the observer takes compass bearings to the three landmarks given in the last column of the tables opposite the boundary corner in question. These bearings are then corrected for the local declination,<sup>a</sup> and if the results agree with the published bearings the buoy is correctly located.

In the case where the buoy is not in its correct position, or has disappeared altogether, the desired point can be determined by maneuvering the vessel until the corrected bearings agree with the ones in the tabular descriptions, when the buoy can be anchored in its proper location.

In the case where the landmarks for which the bearings are published have been destroyed or washed away, any landmarks whose positions are indicated on the charts can be used by getting their bearings directly from the chart by parallel rulers or a protractor and then applying them in the same manner as the ones published in the tables.

(4) *Magnetic bearings from shore.*—This method will be of special value to engineers having an ordinary surveyor's compass. The compass can be set over the point marking a "triangulation station" on shore, the name of which is given in the last column opposite the "corner" in question. The instrument is then set at the corresponding

<sup>a</sup>The mean magnetic variation of Somerset County for 1908 was 5° 30' west of north and increasing at the rate of 3' yearly.

“back” bearing (corrected for local magnetic declination), given in the fourth column of the tables opposite the “corner” in question and on line with the name of the “station” being occupied. The direction thus determined will give one range on which the desired point must be located. The compass can then be moved to a second triangulation station and another range located in a similar manner. The intersection of these two range lines will give the desired point; but in general it should be checked by an additional range line determined from a third station.

(5) *Horizontal angles measured at landmarks.*—This process is a modification of the triangulation method, and will be useful to engineers who have a transit and desire considerable accuracy.

The instrument is placed over a “triangulation station,” the name of which appears in the last column of the tabular description opposite the “corner” in question. The telescope is then pointed to the landmark indicated in the “Descriptions of landmarks” as having a direction of  $0^{\circ} 00' 00''$  from the triangulation station being occupied by the transit. The tabular description of the boundaries is next examined and the “back” bearing of the questionable boundary “corner” from the landmark being occupied is taken out. The angle calculated from the “back” bearing and the bearing given in parentheses alongside the zero landmark in the “Descriptions of landmarks” is then set off on the transit, and a range line established on which the desired point must be located. A similar process is then carried on at a second station, and so on until the position of the buoy is satisfactorily fixed.

## BOUNDARIES OF CRAB BOTTOMS.

## EXPLANATION OF DESCRIPTIONS OF BOUNDARIES.

The laws providing for the survey of the oyster bars of Maryland also contain a section which requires "an accurate survey of and delineation upon the maps and charts aforesaid of all bottoms of the tributaries of the Chesapeake Bay where grass grows and it is profitable to scrape for soft shell or shedder crabs, and shall have such bottoms properly designated by permanent objects on the shore, as provided hereinbefore for natural oyster beds, bars, and rocks, which said crabbing sections shall be exempt from leasing for oyster culture."

The crab bottoms of Somerset County are the first ones to be surveyed in Maryland,<sup>a</sup> and as far as known such a survey is altogether a new problem which differs<sup>b</sup> in many ways from that of a survey of oyster bars.

In a general way it can be stated that the boundaries of the crab bottoms as established by the Maryland Shell Fish Commission and delineated on the "Charts of Oyster Bars," published by the Coast and Geodetic Survey, are confined to waters between the 1-fathom contour (6 feet depth of water) and the shore line. Therefore, in most cases the mean low water line of the shore has been adopted as an inner boundary for the

<sup>a</sup> Anne Arundel County has no crab bottoms within the meaning of the law.

<sup>b</sup> See pages 69 to 70 of "First Annual Report of Maryland Shell Fish Commission" for description of "Survey of crabbing grounds."

crab bottoms, but the same system of straight lines and numbered corners used to delineate the oyster bars has been retained for defining the offshore water boundaries.

There are 54 individual "crab bottoms" in Somerset County exempt from leasing for oyster culture which have been surveyed and delineated under separate names by the Commission, and their total area as determined by the hydrographic engineer of the Commission is 32,108 acres. The largest of these bottoms is 2,182 acres and the smallest 23 acres.

The boundaries of the crab bottoms of Somerset County as established by the Shell Fish Commission and shown on the Coast and Geodetic Survey charts and projections and on the "leasing charts" of the Commission are technically defined and described by a method but little different from that used for the description of the boundaries of oyster bars.

The descriptions have been arranged in tabular form, thus avoiding many hundred repetitions of the same words by making one explanation of the tables sufficient for all crabbing bottoms in the county.

At the top of each tabular form is given the legal name of the crab bottom to be described, its general locality, and the serial numbers of the "Charts of Oyster Bars" of Maryland on which its boundaries are shown.

The first column, under the heading of "Corner of bottom," gives the number corresponding to the corner of the boundary as shown on the charts. These numbers have been assigned to the corners of the crab bottoms in a slightly different manner from that used in describing the oyster bars, although both proceed in a clockwise direction around their boundaries. In delineating the crab bottoms it was generally planned to have both the first and last corners fall on land, thus making the mean low-water line of the shore between these two corners form the connecting boundary, as is always stated in such cases in a note at the bottom of the tabular descriptions. Where a corner of one bottom is identical with the corners of one or more other crab bottoms, oyster bars, or clam beds, only the number of the crab bottom being described in the table is given in this column.

The second and third columns, under the headings of "Latitude" and "Longitude," give the geographic positions of the corners. These positions have been adopted by the Commission as the primary technical definitions of the corners, and should be considered as final in case of a dispute arising from discrepancies caused by other means of location. The latitudes and longitudes given in these columns are based on the United States standard datum of the Coast and Geodetic Survey, and the points thus defined can be relocated from distant triangulation stations of the Survey, even though all the landmarks and buoys used for their original location have been destroyed.

The fourth and fifth columns, under the general heading of "True bearing" <sup>a</sup> and the specific headings of "Forward" and "Back," give bearings measured from a true north and south line. The three "Forward" bearings are from the corner of the boundary designated in the first column to the triangulation stations named on the corresponding lines in the last column, and the three "Back" bearings are from these same stations in the last column to the corresponding corner of boundary in the first column.

<sup>a</sup> The mean magnetic variation of Somerset County for 1908 was 5° 30' west of north and increasing at the rate of 3' yearly.

The sixth column, under the heading of "Distance," gives the three computed distances in yards from the corner of the crab bottom noted in the first column to the three triangulation stations named on the corresponding lines in the last column, and vice versa.

The seventh and last column, under the heading of "U. S. C. & G. S. triangulation station," gives the names of the landmarks from which were computed the corresponding "Latitude," "Longitude," "True bearing," and "Distance" of the "Corner of the bottom" designated in the first column. A full description of the location and markings of these triangulation stations is given in another part of this publication, under the heading of "Descriptions of landmarks."

The descriptive note of the shore line boundary which usually follows the description of the last corner on the tabular form and sometimes between intermediate corners which happen to fall on land requires no explanation, other than to state that the laws of Maryland reserve to riparian owners all waters of "any creek, cove, or inlet less than one hundred yards in width at its mouth at low tide."

SURVEYING METHODS FOR RELOCATION OF BOUNDARIES.

There are a number of methods that can be used in the relocation of the actual boundaries of the crab bottoms as technically described in this publication and delineated on the published charts of the Coast and Geodetic Survey, but as they are practically the same as those required for the relocation of oyster-bar boundaries the description of the "Surveying methods for relocation of boundaries" under the heading of "Boundaries of oyster bars" in this publication will be sufficient to indicate several methods that can be used in the relocation of crab-bottom boundaries.

## BOUNDARIES OF CLAM BEDS.

## EXPLANATION OF DESCRIPTIONS OF BOUNDARIES.

The Maryland legislature of 1908 in an act<sup>a</sup> passed to prescribe additional duties to be performed by the Board of Shell Fish Commissioners provided for the establishment of boundaries of certain clam beds in Pocomoke Sound, which were to be "surveyed and designated on charts" and records prepared and filed in every particular as provided for by the Maryland laws for the survey of natural oyster bars.

The clam beds specified by the law are only 3 in number, with total acreage of 506 acres, the largest bed being 180 acres and the smallest 152 acres.

The boundaries of these clam beds were surveyed and established by the Shell Fish Commission and delineated on the "Charts of Oyster Bars" published by the Coast and Geodetic Survey in a manner identical with that used for the establishment of the oyster bar boundaries. Therefore the "Explanation of descriptions of boundaries," under the heading of "Boundaries of oyster bars," to be found in another part of this publication, will apply to the clam beds.

<sup>a</sup> For the text of this act see Appendix B of this publication.

SURVEYING METHODS OF RELOCATION OF BOUNDARIES.

For similar reasons to those given under the previous heading, the "Surveying methods of relocation of boundaries," given under the heading of "Boundaries of oyster bars," to be found in another part of this publication, will apply to clam beds.

## APPENDIXES.

### APPENDIX A.—LAWS RELATING TO THE COOPERATION OF THE COAST AND GEODETIC SURVEY AND BUREAU OF FISHERIES WITH THE MARYLAND SHELL FISH COMMISSION.

The work of the Coast and Geodetic Survey and of the Bureau of Fisheries, in cooperation with the Maryland Shell Fish Commission, in surveying the oyster bars, establishing permanent landmarks at triangulation stations, and preparing for publication the necessary charts and technical and legal descriptions of boundaries and landmarks shown on these charts, has been executed in compliance with a request from the governor of the State of Maryland to the Secretary of Commerce and Labor, and by the authority of the following laws of the United States and Maryland:

[Act of Congress approved May 26, 1906.]

AN ACT To authorize the Secretary of Commerce and Labor to cooperate, through the Bureau of the Coast and Geodetic Survey and the Bureau of Fisheries, with the shellfish commissioners of the State of Maryland in making surveys of the natural oyster beds, bars, and rocks in the waters within the State of Maryland.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the Secretary of Commerce and Labor be, and he is hereby, authorized and directed, upon the request of the governor of the State of Maryland, to designate such officers, experts, and employees of the Bureau of the Coast and Geodetic Survey and of the Bureau of Fisheries as may be necessary to cooperate with the Maryland State board of shellfish commissioners in making a survey of and locating the natural oyster beds, bars, and rocks in the waters within the State of Maryland; and the Secretary of Commerce and Labor is hereby authorized and directed to furnish to the officers, experts, and employees of said Bureaus so detailed as aforesaid such instruments, appliances, and steam launches as may be necessary to make the survey aforesaid; and the Secretary of Commerce and Labor is hereby authorized to have made in the Bureau of the Coast and Geodetic Survey all the plats necessary to show the results of the aforesaid survey and the locations of the said natural oyster beds, bars, and rocks in the waters within the State of Maryland, and to furnish to the board of shellfish commissioners of the State of Maryland such copies as may be necessary, and for this purpose to employ, in the District of Columbia and elsewhere, such technically qualified persons as may be necessary to carry out the purpose of this act.

SEC. 2. That the Secretary of Commerce and Labor is hereby further authorized to have erected or constructed by the officers so detailed as aforesaid, while making such survey, such structures as may be necessary to mark the points of triangulation, so that the same may be used for such future work of the Coast and Geodetic Survey as the said Bureau may hereafter be required to perform in prosecuting the Government coast survey of the navigable waters of the United States located within the State of Maryland.

\* \* \* \* \*

SEC. 4. That this act shall take effect from the date of its passage.

[Act of Congress approved June 30, 1906.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth nineteen hundred and seven, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and seven, namely: \* \* \*

*Survey of Oyster Bars, Somerset County, Md.*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including the expenditures authorized under Public Act Numbered One hundred and eighty-one, approved May twenty-sixth, nineteen hundred and six, and contingent expenses incident thereto, five thousand dollars, together with the unexpended balance under this appropriation for nineteen hundred and six and prior years which is hereby reappropriated and made available on this account for the fiscal year nineteen hundred and seven. \* \* \*

[Act of Congress approved March 4, 1907.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and eight, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and eight, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, to be immediately available and to continue available until expended, twenty-five thousand dollars. \* \* \*

[Act of Congress approved May 27, 1908.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and nine, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and nine, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, which expenses, including cost of plats and charts, shall not exceed fifteen thousand dollars in any one year, to be immediately available, twenty thousand dollars.

[Act of the legislature of Maryland approved April 2, 1906.]

AN ACT to establish and promote the industry of oyster culture in Maryland, to define and mark natural oyster beds, bars and rocks lying under the waters of this State, to prescribe penalties for the infringement of the provisions of this Act, and \* \* \*

SECTION 1. *Be it enacted by the General Assembly of Maryland,* That the following sections be, and they are hereby, added to Article 72 of the Code of Public General Laws, title "Oysters." \* \* \*

SEC. 86. The Board of Shell Fish Commissioners shall, as soon as practicable after the passage of this Act, cause to be made a true and accurate survey of the natural oyster beds, bars and rocks of this State, said survey to be made with reference to fixed and permanent objects on the shore, giving courses and distances, to be fully described and set out in a written report of said survey, as hereinafter required. A true and accurate delineation of the same shall be made on copies of published maps and charts of the United States coast and geodetic survey, which said copies shall be filed in the office of the said commissioners in the city of Annapolis; and the said commissioners shall further cause to be delineated upon copies of the published maps and charts of the United States coast and geodetic survey, of the largest scale, one copy for each of the counties of this State in the waters of which there are natural oyster beds, bars and rocks, all natural beds, bars and rocks lying within the waters of such county, which maps shall be filed in the offices of the clerks of the Circuit Court for the respective counties wherein the grounds so designated may lie.

\* \* \* \* \*

SEC. 87. The Governor of this State is hereby requested to ask the assistance of the United States coast and geodetic survey, and of the United States Fish Commissioner, to aid in the carrying out of the provisions of the preceding section. \* \* \*

SEC. 89. As soon as practicable after the first day of April, 1906, the said commissioners shall organize, and shall at once proceed, with the assistance of such person or persons as may be detailed by the United States coast and geodetic survey, and the United States Fish Commissioner, to aid them in their work, and of such persons as may be appointed under the preceding section, to have laid out, surveyed and designated on the said charts, the natural beds and bars, and shall cause to be marked and defined as accurately as practicable, the limits and boundaries of the natural beds, bars and rocks, as established by said survey, and they shall take true and accurate notes of said survey in writing, and make an accurate report of said survey, setting forth such a description of landmarks as may be necessary to enable the said board, or their successors, to find and ascertain the boundary lines of the said natural oyster beds, bars and rocks, as shown by a delineation on the maps and charts provided in this Act; said report shall be completed and filed in the office of the board in the city of Annapolis within ninety days after the completion of the survey of any county. Said commissioners shall cause the same to be published in pamphlet form, and transmit copies of the same to the clerks of the Circuit Court for the respective counties, where the charts have been filed or directed to be filed as hereinafter provided; the said report to be filed by the clerks of the several counties in a book kept for that purpose. And the said survey and report, when filed, subject to the right of appeal hereafter provided for in this Act, shall be taken in all of the courts of this State as conclusive evidence of the boundaries and limits of all natural oyster beds, bars and rocks, lying within the waters of the county wherein such survey and report are filed, and shall be construed to mean in all of the said courts that there are no natural oyster beds, bars or rocks lying within the waters of the counties wherein such report and survey are filed, other than those embraced in the survey authorized by this Act, and that all areas of the Chesapeake Bay and its tributaries within the State of Maryland, not shown in the survey to be natural oyster beds, bars or rocks, shall be construed in all the courts of the State to be barren bottoms, and open for disposal by the State for the purpose of private planting or propagation of oysters thereon under the provisions of this Act; provided, that the said survey and report shall not be so construed as to affect in any manner the holdings by citizens of this State in any lot which may have been appropriated or taken up under the laws of this State prior to the approval of this Act. \* \* \*

The law of the State of Maryland, passed March 9, 1842, authorizing officers of the United States Coast and Geodetic Survey to enter upon the lands within the State limits for the purposes of the Survey, is as follows:

An Act Concerning the Survey of the Coast of Maryland.

SECTION 1. *Be it enacted by the General Assembly of Maryland,* That it shall and may be lawful for any person or persons employed under and by virtue of an act of the Congress of the United States, \* \* \* at any time hereafter to enter upon lands within this State for the purpose of exploring, surveying, triangulating, or levelling, or doing any other matter or thing which may be necessary to effect the objects of said act, and to erect any works, stations, buildings, or appendages requisite for that purpose, doing no unnecessary injury to private or other property.

SEC. 2.<sup>a</sup> *And be it enacted,* That in case the person or persons employed under the act of Congress aforesaid, can not agree with the owners or possessors of the land so entered upon and used as to the amount of damage done thereto by reason of the removal of fences, cutting of trees or injury to the crop or crops growing on the same, it shall and may be lawful for the said parties or either of them to apply to the chief justice for the time being or one of the associate judges of the judicial district in which such land may be situated, who shall thereupon appoint three disinterested and judicious freeholders, residents of the same judicial district, to proceed with as much despatch as possible to the examination of the matter in question, and the faithful assessment of the damages sustained by the owners or possessors aforesaid, and the said freeholders or a majority of them, having first taken and subscribed an oath or affirmation before the chief or associate justice aforesaid or other person duly authorized to administer the same, that they will well and truly examine and assess as aforesaid, and having given five days' notice to both parties of the time of their meeting, shall proceed to the spot, and then and there upon their own view and if required, upon the evidence of witnesses, (to be by

<sup>a</sup> Under the rulings of the Comptroller of the Treasury no damages can be collected except through the United States Court of Claims unless an agreement has been made in advance.

(them sworn or affirmed and examined) shall assess the said damages, and shall afterward make report thereof and of their proceedings in writing under their hands and seals and file the same within five days thereafter in the office of the clerk of the county in which the land aforesaid is situated, subject to an appeal by either party to the county court of the said county within ten days after filing as aforesaid, and the said report so made as aforesaid, if no appeal as aforesaid be taken, shall be held to be final and conclusive as between the said parties, and the amount so assessed and reported shall be paid to the said owners or possessors of the land so damaged within twenty days after the filing of said report, and the said chief or associate justice as aforesaid, shall have authority to tax and allow upon the filing of said report, such costs, fees and expenses to the said freeholders for the performance of their duty as he shall think equitable and just, which allowance shall be paid by the person or persons employed under the act of congress aforesaid, within the time last above limited, but if an appeal as aforesaid be taken, the case shall be set down for hearing at the first term of county court aforesaid, ensuing upon and after appeal, and it shall be lawful for either party immediately after the entry of such appeal, to take out summons for such witnesses as may be necessary to be examined upon the hearing aforesaid, and the said court shall have power in its discretion to award costs against which ever the final judgment shall be entered, and such appeal at the option of either party may and shall be heard before and the damages assessed by a jury of twelve men to be taken from the regular panel and elected as in other cases.

SEC. 3. *And be it enacted*, That if any person or persons shall wilfully injure or deface or remove any signal, monument or building or any appendage thereto, erected, used or constructed under and by virtue of the act of congress aforesaid, such person or persons so offending shall severally forfeit and pay the sum of fifty dollars with costs of suit to be sued for and recovered by any person who shall first prosecute the same before any justice of the peace of the county where the person so offending may reside, and shall also be liable to pay the amount of damages thereby sustained, to be recovered with costs of suit in an action on the case, in the name and for the use of the United States of America, in any court of competent jurisdiction.

#### APPENDIX B.—LAWS RELATING TO SURVEY OF CLAM BEDS.

[Act of the legislature of Maryland approved April 6, 1908.<sup>a</sup>]

AN ACT to prescribe additional duties to be performed by the Board of Shell Fish Commissioners, to the duties already prescribed for them by Chapter 711 of the Acts of the General Assembly of Maryland of 1906.

SECTION 1. Be it enacted by the General Assembly of Maryland, That it shall be the duty of the Board of Shell Fish Commissioners, as soon after the passage of this Act as practicable, to have laid out, surveyed and designated on charts provided for such purpose, Gravel Rock, Ware Rock, and Flat Rock, being clam banks located in the waters of Pocomoke Sound, in Somerset county, and State of Maryland, and shall cause to be marked and defined as accurately as practicable the limits and boundaries of each of the above named rocks, and they shall take true and accurate notes of said survey and make the report and perform all other duties connected with said survey as said duties are prescribed by Chapter 711 of the Acts of the General Assembly of Maryland of 1906, pertaining to natural oyster beds and bars.

SEC. 2. And be it enacted by the General Assembly of Maryland, That after said rocks shall have been surveyed as provided in Section 1 of this Act, no part of them shall be leased to any person or persons for the purpose of planting, bedding or cultivating oysters, thereon, but they shall be reserved to the public in the State of Maryland for the sole purpose of taking clams therefrom, and shall be treated in every particular as are the natural oyster beds or bars which have been or shall be surveyed by the Board of Shell Fish Commissioners under Chapter 711 of the Acts of the General Assembly of Maryland of 1906.

SEC. 3. And be it further enacted, That this Act shall take effect from the date of its passage.

<sup>a</sup>As published in bill form.

*Survey of Oyster Bars, Somerset County, Md.*

117

APPENDIX C.—STATISTICS OF RESULTS OF THE COMBINED OPERATIONS OF THE GOVERNMENT AND STATE.

For a further understanding of the character of the oyster survey work that is being carried on in Maryland the following statistical tabulations of the combined results of the various operations of both the Government and State will be of value. In this connection it should be remembered that these statistics only include the new work required to supplement the large amount of existing data obtained from the archives of Coast and Geodetic Survey and utilized in the preparation of the charts and technical records.

Operation.	Anne Arundel County.	Somerset County.	Total. (a)
Natural oyster bars surveyed and delineated.....	91	37	128
Acres of natural oyster bars.....	33,666	27,566	(b) 61,232
Crab bottoms surveyed and delineated.....		54	54
Acres of crab bottoms.....		32,108	32,108
Clam beds surveyed and delineated.....		3	3
Acres of clam beds.....		506	506
Number of oyster lots leased and surveyed.....	38	185	223
Acres of oyster lots leased and surveyed.....	203	920	1,123
Boundary buoys located and planted.....	362	154	516
Triangulation landmarks established.....	123	86	209
Miles of shore line covered by triangulation.....	110	125	235
Square miles of water covered by triangulation.....	220	375	595
Miles of examination of shell bottom with chain apparatus.....	369	296	665
Oyster investigation stations occupied.....	440	679	1,119
Number of soundings over shell bottoms.....	37,049	17,904	54,953
Square miles covered by soundings and chain apparatus.....	58	47	105
Projections prepared and plotted.....	9	13	22
Leasing charts prepared.....	13	12	25
Oyster charts published.....	4	6	10
Reports published.....	2	2	3
Progress maps published.....	2	2	3

(a) Less quantities covered by statistics of more than one county.

(b) Total area of natural oyster bars of Connecticut is 5,770 acres.

APPENDIX D.—THE HAMAN OYSTER CULTURE LAW.

[Extract from First Report of Shell Fish Commission.]

OBJECT.

"The legislature in placing chapter 711 of the acts of 1906, better known as the Haman Oyster Culture Law, upon the statute books of Maryland had a twofold object in view:

1. To encourage an industry in oyster culture upon the barren bottoms beneath the tidewaters of the State.

2. To prevent the leasing of natural oyster bars for the purpose of oyster culture."

SURVEY.

"To make the leasing of barren bottoms possible and the leasing of natural bars impossible, provision was made for a survey of the natural bars for the purpose of accurately locating and marking the same. It was definitely provided that no barren bottoms should be leased in any part of the State until the natural bars of that region had been surveyed, charted, and marked with buoys."

## NATURAL BAR NOT DEFINED.

"The Shell Fish Commission is instructed by section 90 of the Haman Oyster Culture Law to exercise its judgment liberally in favor of the natural bars when surveying, charting and buoying them, but other than this the Commission is uninstructed in this important matter. The responsibility of defining a natural bar is placed upon the Commission."

## DEFINITION OF A NATURAL OYSTER BAR.

## DIVERSITY OF OPINION.

"No definition of a natural oyster bar could be formulated by any man or body of men which would meet with the approval of all parties concerned. Oystermen, as a rule, hold that all bottoms where oysters grow or have grown naturally even though now practically barren of oysters should be considered natural bars. Other citizens of the State who are not directly interested in the oyster business, but interested in the oyster industry from the standpoint of revenue, hold, as a rule, that no bottoms should be excluded from leasing for oyster culture which, by methods known to oyster culturalists, may be made to yield a greater number of oysters than they now produce."

"It should be evident to every one that neither of these definitions could be adopted by the Commission as a working basis for determining which of the grounds surveyed are natural oyster bars."

## THE GOLDSBOROUGH DEFINITION.

"The definition of a natural bar which very nearly approaches a reasonable and satisfactory compromise between the extreme views given above and which has therefore been adopted by the Commission, is that contained in an opinion rendered by Judge Charles F. Goldsborough in the circuit court for Dorchester County in the July term, 1881, in the case of William T. Windsor and George R. Tood, v. Job T. Moore. It is as follows:

What then is a natural bar or bed of oysters? It would be a palpable absurdity for the State to attempt to promote the propagation and growth of oysters and to encourage its citizens, by a grant of land, to engage in their culture, if the lands authorized to be taken up were only those upon which oysters do not and can not be made to grow. That there may be lands covered by water in the State where no oysters can be found, but where, if planted, they could be cultivated successfully, may be possible, but, if so, I imagine that their extent must be too limited for them to be of much practical, general advantage for the purposes of such a law as the one under discussion; but there are thousands of acres of hard and shifting sands where oysters not only are not found, but where it would be folly to plant them; and these latter it can not be supposed that the State intended to offer to give away, for the simple reason that the State could not help knowing that nobody would have them.

Upon the other hand there are large and numerous tracts where oysters of natural growth may be found in moderate numbers, but not in quantities sufficient to make it profitable to catch them, and yet where oysters may be successfully planted and propagated. In my opinion these can not be called natural bars or beds of oysters, within the meaning of the Act of Assembly, and it is just such lands as these that the State meant to allow to be taken up under the provisions of the above-mentioned section of the Act.

But there is still another class of lands where oysters grow naturally and in large quantities and to which the public are now and have been for many years in the habit of resorting with a view to earning a livelihood by catching this natural growth, and here, I think, is the true test of the whole question. Land can not be said to be a natural oyster bar or bed merely because oysters are scattered here and there upon it, and because if planted they will readily live and thrive there; but whenever the natural growth is so thick and abundant that the public resort to it for a livelihood, it is a natural oyster bar or bed and comes within the above-quoted restriction in the law, and cannot be located or appropriated by any individual."

## LETTER OF SUBMITTAL.

---

DEPARTMENT OF COMMERCE AND LABOR,  
COAST AND GEODETIC SURVEY,

*Washington, July 20, 1912.*

SIR: I have the honor to transmit herewith a report of the officer detailed from the Coast and Geodetic Survey to cooperate with the Bureau of Fisheries and the Maryland Shell Fish Commission in surveying the oyster bars of the State of Maryland, together with certain technical results which are necessary for the interpretation and use of the plats of the survey made by the Government.

This work has been done under the provisions of the act of Congress entitled "An act to authorize the Secretary of Commerce and Labor to cooperate, through the Bureau of the Coast and Geodetic Survey and the Bureau of Fisheries, with the Shell Fish Commissioners of the State of Maryland in making surveys of the natural oyster beds, bars, and rocks in the waters within the State of Maryland," approved May 26, 1906, and of the acts of Congress making appropriations for sundry civil expenses of the Government for the fiscal years ending June 30, 1907, 1908, 1909, 1910, 1911, and 1912.

Respectfully,

O. H. TITTMANN, *Superintendent.*

To HON. CHARLES NAGEL,  
*Secretary of Commerce and Labor.*

LETTERS OF MARY WELLS

Dear Mother,

I have the honor to thank you for the kind letter of the 10th inst. and for the money which you have so kindly sent me. I have received it and it is very much appreciated. I have not time to write you more at present but will do so again soon. I am well and hope these few lines will find you the same. I have not time to write you more at present but will do so again soon. I am well and hope these few lines will find you the same.

Yours affectionately,

Mary Wells

21

## CERTIFICATION.

---

BALTIMORE, MD., *May 4, 1912.*

The following publication is certified to contain correct technical descriptions of all boundaries and landmarks established in Talbot County by the Maryland Shell Fish Commission in cooperation with the United States Coast and Geodetic Survey.

C. C. YATES,  
*Chief of Coast and Geodetic Survey Party,*  
*Assistant, Coast and Geodetic Survey.*

---

Examined and certified to be correct.

BALTIMORE, MD., *May 4, 1912.*

WALTER J. MITCHELL,  
CASWELL GRAVE,  
BENJAMIN K. GREEN,  
*Maryland Shell Fish Commission.*  
SWEFSON EARLE,  
*Hydrographic Engineer.*

NOTE.—Certified copies of this publication and of the charts of the natural oyster bars of Talbot County were filed in the office of the clerk of the circuit court of Talbot County and in the office of the Board of Shell Fish Commissioners on July 20, 1912.

# SURVEY OF OYSTER BARS, TALBOT COUNTY, MD.

## INTRODUCTION.

### PUBLICATIONS.

The preparation of publications relating to the survey of the oyster bars of Maryland has been divided between the Government and the State in accordance with the laws<sup>1</sup> authorizing the work and the natural division of the surveying operations<sup>2</sup> of the cooperating forces.

The publications prepared and issued by the Government under the direction of the Superintendent of the Coast and Geodetic Survey consist of a series of charts and a technical report for each county surveyed.<sup>3</sup> The charts show all legal boundaries of oyster bars within the adopted boundaries of the waters opened up for leasing with each county, and the location of all landmarks (Coast and Geodetic Survey triangulation stations) used as a foundation for the delineation of these various boundaries. The technical report gives technical and legal descriptions of all oyster bar and other boundaries, and descriptions of all landmarks shown on the charts, and includes the report of the representative of the Coast and Geodetic Survey in charge of the work of that service in cooperation with the Bureau of Fisheries and the Maryland Shell Fish Commission. These charts and technical reports are prepared and certified for file with the courts and the Commission, as required by the laws of the State, and contain all information necessary to make a permanent record of the work of the Commission and the Government for all future requirements of the courts, or for any resurveys that may become necessary.<sup>4</sup>

The publications prepared and issued by the State under the direction of the Shell Fish Commission consist of annual reports<sup>5</sup> of all the operations of the Commission performed under the provisions of the laws of Maryland,<sup>6</sup> including results of biological

<sup>1</sup> See Appendix A for laws relating to the cooperation of the Coast and Geodetic Survey and Bureau of Fisheries with the Maryland Shell Fish Commission.

<sup>2</sup> See Appendix C for a summary of the particular surveying operations which constitute an "oyster survey" as now being carried on in Maryland.

<sup>3</sup> These charts and technical reports can be obtained by application to the Superintendent of the Coast and Geodetic Survey at Washington, D. C. The publications now ready for issue are those for Anne Arundel, Somerset, Wicomico, Worcester, Calvert, Charles, St. Marys, Baltimore, Kent, Queen Annes, and Talbot Counties.

<sup>4</sup> The technical records and charts for each county are published separately on account of the requirements of the oyster-culture laws of the State and the practical considerations which make it desirable to have each county "opened up" for oyster culture as soon as practicable after the completion of its survey. For these reasons and the fact that these reports are each arranged for distribution and use in one county only without reference to other published records, much of the text of this publication is of necessity identical with similar previous publications for other counties.

<sup>5</sup> These reports can be obtained by application to the Shell Fish Commission, Marine Bank Building, Baltimore, Md. They are issued annually in October, and the first, second, third, and fourth reports are now available for distribution.

<sup>6</sup> See Appendix B for an extract from the "Second Report of the Maryland Shell Fish Commission," giving a concise summary of the "Haman oyster-culture law."

and economic oyster investigations, methods and results of the hydrographic survey of the boundaries of oyster bars and crab bottoms, the administrative report and financial statement of the Commission, information relating to oyster culture, methods of surveying and leasing of oyster lots, and much other important matter of legal and scientific value.

These two sets of publications are planned and arranged to supplement each other without unnecessary duplication, and when combined they form a complete report of operations, methods, and results of the work of both the Government and State.<sup>1</sup>

#### COOPERATION OF THE COAST AND GEODETIC SURVEY.

The work of the Coast and Geodetic Survey, as the name of the service indicates, includes a survey of the coasts of the United States made on a geodetic basis. This has involved the gradual construction of a great framework of interstate triangulation for use as a foundation for detail hydrographic and topographic surveys, from which there has been compiled and published a complete set of charts of the coasts of the United States, including all waters of Maryland where oysters grow. This existing triangulation, hydrography, and topography is essential as a foundation for a correct and practical survey of natural oyster bars; and it being one of the fundamental functions of the Coast and Geodetic Survey to furnish such data, the cooperation of the Coast and Geodetic Survey with the Bureau of Fisheries and the Maryland Shell Fish Commission is a practical and natural development of Government work leading to the conservation and increase of the supply of food.

#### COOPERATION OF THE BUREAU OF FISHERIES.

The Bureau of Fisheries has cooperated with the Coast and Geodetic Survey and the Maryland Shell Fish Commission principally as an adviser in matters relating to the biological and economic survey of oyster bars and the methods to be employed for that purpose.<sup>2</sup> A steam launch, rowing boat, and certain apparatus have also been furnished.

The primary function of the Bureau of Fisheries is to increase the productiveness of marine and fresh waters by such measures as may be best suited to the purpose, and the services rendered in connection with the survey of the oyster bars of Maryland are strictly in line with the fundamental law under which it acts. In certain States other than Maryland similar work has been conducted by the bureau acting independently, the same ends being attained at greater expense to the Government.

#### GENERAL STATEMENT OF WORK OF COAST AND GEODETIC SURVEY.<sup>3</sup>

The results obtained from the work of the Coast and Geodetic Survey in cooperation with the Bureau of Fisheries and the Maryland Shell Fish Commission need very little other summary than is indicated by the published "Charts of Natural Oyster Bars" and the index of hydrographic projections and triangulation stations shown on the county progress maps attached to each report.

<sup>1</sup> See Appendix D of this publication for "Statistics of results of combined operations of the Government and State."

<sup>2</sup> Hon. George M. Bowers, Commissioner of Fisheries, has detailed for this service Dr. H. F. Moore, assistant, Bureau of Fisheries.

<sup>3</sup> For a detail statement of the very large amount of excellent oyster-survey work of the Maryland Shell Fish Commission see the "Annual Reports of the Maryland Shell Fish Commission."

The triangulation has been carried on in accordance with the standard methods of the Coast and Geodetic Survey, making this work and that of the "Descriptions of Triangulation Stations" of permanent value, not only to the State of Maryland in the survey of her oyster bars but also to the Government for any future work it may do in the regions covered by the oyster-survey operations.

The hydrographic projections and published charts are prepared with all the accuracy permitted by their large scale, especially as to the boundaries of the various shellfish bottoms in relation to landmarks, but this accuracy of location on the charts is further added to and permanently fixed by published technical descriptions which should minimize the probability of any future dispute as to either landmarks or boundaries.

Stated another way, and quoting from the report of the "Survey of Oyster Bars of Anne Arundel County":

The geographic positions of the permanent landmarks and signals have been determined with the usual precision of a trigonometric survey, and their locations at all points necessary to provide ample foundation for the surveying and charting operations permitted great accuracy of definition and location for the natural oyster-bar and other boundaries established. At the same time the very important element of permanency of the positions of boundaries has been secured, as the relocation of geodetic positions can always be accomplished by a competent surveyor, even though the original landmarks and monuments have been washed away, as has been the fate of hundreds of such points established by the Coast and Geodetic Survey on the shores of the Chesapeake Bay during the last 65 years.

REPORT OF THE WORK OF THE COAST AND GEODETIC SURVEY IN TALBOT COUNTY.

INSTRUCTIONS.

The following letters, together with the laws<sup>1</sup> of the United States relating to the subject, constitute the "instructions" received by the chief of the Coast and Geodetic Survey party engaged on work in connection with the Maryland Shell Fish Commission. They are short and definite, but furnish ample authority and leeway for all legitimate development of the cooperation of the Government and the State in the survey of oyster bars. The "free hand" permitted by these orders, together with the aid and many valuable suggestions received from the officers of the survey at Washington, have proved very beneficial to the work and are greatly appreciated:

DEPARTMENT OF COMMERCE AND LABOR,  
OFFICE OF THE SECRETARY,  
*Washington, June 2, 1906.*

SIR: In reply to your letter of May 28, requesting me to designate officers of the Coast and Geodetic Survey and of the Bureau of Fisheries to cooperate with the State of Maryland in making survey of and locating the natural oyster beds, I have the honor to inform you that Mr. C. C. Yates will be designated to cooperate on the part of the Coast and Geodetic Survey as soon as Congress makes the provisions of the act effective by providing an appropriation for the purpose.

Respectfully,

LAWRENCE O. MURRAY, *Assistant Secretary.*

His Excellency HON. EDWIN WARFIELD,  
*Governor of Maryland, Annapolis, Md.*

---

DEPARTMENT OF COMMERCE AND LABOR,  
COAST AND GEODETIC SURVEY,  
*Washington, July 3, 1906.*

SIR: Upon the receipt of these instructions you will surrender the command, accounts, etc., of the steamer *Endeavor* to the Hydrographic Inspector \* \* \*.

As soon as this transfer is completed you will enter upon the duties of Coast Survey representative on the Shell Fish Commission of Maryland.

You will consult the Commissioners, prepare a program of work, and submit estimates in the usual form.

You are authorized to come to Washington for consultation from time to time as may be necessary.

\* \* \* \* \*

Very respectfully,

O. H. TITTMANN, *Superintendent.*

Capt. C. C. YATES,  
*U. S. C. & G. S. Steamer "Endeavor," Baltimore, Md.*

---

<sup>1</sup> For these laws see Appendix A.

## ORGANIZATION AND EQUIPMENT.

The personnel and occupation of the party of the Coast and Geodetic Survey have remained practically unchanged since the beginning of the "oyster survey." Besides the chief of party, it consists of the necessary triangulators, computers, draftsmen, and temporary employees required to carry on both the surveying operations in the field and the preparation for publication of oyster charts and technical records in the office at Washington.

The equipment for the work of the party has been ample and satisfactory. The large living and office quarters furnished the Government on the Maryland Shell Fish Commission house-boat *Oyster* have been very convenient for the work, besides facilitating efficient cooperation with the surveying and oyster investigation parties of the State. In addition to the accommodations on the *Oyster*, the Coast and Geodetic Survey party has had the constant use of the large launch *Inspector* and several other boats furnished by its own service, and the occasional use of the Bureau of Fisheries launch *Canwasback*<sup>1</sup> and the steamer *Governor McLane*<sup>2</sup> of the State Fishery Force.

The greater part of the equipment of instruments for the operations of both the Government and State has been furnished by the Coast and Geodetic Survey, and consists of all necessary theodolites, levels, sextants, drafting instruments, hydrometers, etc., required for all field and office work.

## CHRONOLOGICAL STATEMENT OF WORK.

The field work of the Coast and Geodetic Survey in Talbot County<sup>3</sup> dates from July 6, 1909, when the Maryland Shell Fish Commission house-boat *Oyster* was towed by the State Fishery Force steamer *Governor McLane* to an anchorage in the northern part of Prospect Bay near the southern entrance to Kent Narrows. From this harbor as headquarters a few additional triangulation observations were made in Kent County, although the greater part of the work was confined to Talbot and Queen Annes Counties.

On July 22, 1909, the house-boat was moved to the vicinity of Rockhall, and all field work in Talbot County was discontinued until August 13, 1909, when the *Oyster* was shifted back to Eastern Bay side of Kent Narrows, where she remained only two weeks. During this period Governor Crothers and party visited the house-boat and thoroughly examined into the manner and methods of the work of the Maryland oyster survey.

On August 28, 1909, the *Oyster* was towed to Haddaway Cove in Talbot County, where she stayed for only three days on account of the exposed position of the anchorage.

On August 31, 1909, the *Oyster* changed her anchorage to the very snug harbor inside of Poplar Island, where she remained until all the open Chesapeake Bay work was practically completed as far south as Tilghmans Island. While at this anchorage, one subparty living on shore was engaged on triangulation in Harris Creek with hired boats and an extra party of hands.

<sup>1</sup> By courtesy of Dr. H. F. Moore, United States Bureau of Fisheries.

<sup>2</sup> By courtesy of Capt. James A. Turner, commanding.

<sup>3</sup> The field work of Talbot County was so intermixed with that of Queen Annes and Dorchester Counties that the chronological statement of the work in one of these counties necessarily includes a considerable part of the work of the other two counties.

### *Survey of Oyster Bars, Talbot County, Md.*

On September 22, 1909, the house-boat was towed to DAN COVE in Harris Creek. From this anchorage the triangulation of Harris Creek, as well as a considerable part of Broad Creek, was completed.

On October 16, 1909, the house-boat was moved back to Eastern Bay and tied up at the railway wharf at Claiborne. From this point the triangulation of Eastern Bay and its northern tributaries west of Kent Narrows was practically completed.

On October 29, 1909, the *Oyster* was moved to an anchorage in Tilghmans Creek, which is a branch of the Miles River. The next day completed a month's field work, which was notable as far as triangulation was concerned, on account of the number of stations which were established, marked, described, and located by observations. This number was 108, which is considerably larger than any previous month's record. A good part of this work was carried on by subparty living on shore at Cambridge.

On December 1, 1909, the house-boat *Oyster* was moved from Tilghmans Creek, where she had been for over a month, to an anchorage off St. Michaels. From this harbor the remaining triangulation of Wye River and Miles River was practically completed.

On December 21, 1909, active field work in Talbot County for the calendar year was closed at St. Michaels, but a signal-building subparty continued field work from quarters on shore at Oxford for two days longer.

On December 24, 1909, the field season for the Government parties was officially closed, but the monthly employees remained on the house-boat at Baltimore preparing launches and boats for the winter. All officers were on leave from the 25th to 31st.

On January 3, 1910, which was the first working day of the year, the winter's office work commenced, and the repairs to launches and construction of triangulation monuments were taken up on the house-boat *Oyster* by the foreman and two men.

The office work, which consisted of the completion of records, revising descriptions of location of triangulation stations, triangulation computations, oyster-bar computations, preparation of manuscripts of technical publications, drafting and scaling boundaries of oyster bars, etc., continued without a break, except as noted in the following paragraph.

During the period covered by the winter's office work the Maryland Legislature was in session, and as the consideration of oyster legislation formed a very important and prominent part of its proceedings, considerable time of the chief of party and his officers was expended in gathering and imparting information requested by various State officials.

On March 14, 1910, a subparty was organized and put in the field to complete certain necessary details of triangulation in Talbot and Dorchester Counties. This party first went to St. Michaels, then to Cambridge, and finally to Oxford, where the main party on the house-boat was joined at the end of April.

On April 30, 1910, the house-boat *Oyster* was towed from Baltimore by the State steamer *McLane* to an anchorage in Tar Creek, near Bellevue. While at this harbor the house-boat was cleaned, painted, and generally overhauled for the season's work, and at the same time triangulation was being carried on to completion in Tred Avon River, Island Creek, and other tributaries of lower Choptank River.

On May 30, 1910, the house-boat shifted her anchorage to Tred Avon River off Oxford, where she remained until the practical completion of all the remaining triangulation and other oyster survey work in Talbot County except in the upper Choptank River.

On June 30, 1910, the *Oyster* was towed to an anchorage off Cambridge, and from this point the oyster survey work of Talbot County in upper Choptank River was carried on to completion, together with that of Dorchester County in the adjacent region.

On July 20, 1910, the house-boat *Oyster* was moved to the Patuxent River off Solomons Island, and no further field work was done in Talbot County except from June 20 to June 21, 1912, when a small party was put in the field to complete certain necessary details of triangulation in Talbot and Dorchester Counties.

The office work connected with the oyster survey of Talbot County, including the computation of geographic information and the drafting necessary for the preparation for publication of the oyster charts and the technical records of that county, was carried on intermittingly with the office work of other counties from the beginning of the field work in Talbot County on July 6, 1909, to the time of filing of the certified oyster charts and technical records in the archives of the Maryland Shell Fish Commission and with the clerk of the circuit court of Talbot County on July 20, 1912.

STATISTICS.<sup>1</sup>

Landmarks and triangulation signals erected. ....	315
Monuments planted to mark triangulation stations. ....	311
Triangulation stations occupied for observations of horizontal angles. ....	308
Old triangulation stations recovered. ....	30
New triangulation stations established. ....	306
Total old and new triangulation stations marked and described. ....	336
Linear miles of shore line covered by triangulation (approximate). ....	230
Square miles covered by triangulation (approximate). ....	240
Hydrographic projections prepared and completed as records of oyster boundaries. ....	14
Triangles computed. ....	672
Geographic positions computed. ....	330
Corners of oyster boundaries established by computation. ....	671
Back azimuths and distances computed from corners of boundaries to triangulation stations. ....	2, 013
Descriptions of triangulation stations prepared for publication. ....	336
Descriptions of oyster boundaries prepared for publication. ....	132
"Charts of Natural Oyster Bars" prepared for publication. ....	7
Progress map prepared for publication. ....	1

## GENERAL REMARKS.

Before ending this report the representative of the Coast and Geodetic Survey wishes to renew his statement of appreciation of the courteous assistance received from various Government and State officials and others interested in the oyster industry of Maryland, especially to the following:

<sup>1</sup> These statistics only include field and office work directly performed by the party of the Coast and Geodetic Survey in connection with the oyster survey of this county, and do not include the many thousands of soundings and examinations of the character of the bottom made by the engineers of the Commission, which are of considerable value to the Coast and Geodetic Survey as hydrographic records for future use in connection with the preparation of new editions of charts of the waters of Maryland. See Appendix D of this publication for "Statistics of results of combined operations of the Government and the State."

*Survey of Oyster Bars, Talbot County, Md.*

To his colleague from the Department of Commerce and Labor, Dr. H. F. Moore, of the Bureau of Fisheries, whose well-known scientific knowledge of all matters relating to oysters has been of great value to the work.

To Mr. Walter J. Mitchell, chairman of the Maryland Shell Fish Commission, who, by his administrative ability in carrying out the complicated requirements of the oyster laws and by his unfailing tact, has made the cooperation of the various services engaged on the work both agreeable and effective.

To Dr. Caswell Grave, secretary of the Commission, who, as editor of the Commission's annual report and commissioner in charge of the biological and economic oyster investigations, has been brought into constant contact with the Government work and aided its operations in every way.

To Mr. Benjamin K. Green, treasurer of the Commission, who has looked after the equipment and commissary of the house-boat in such a way as to add greatly to the comfort and convenience of the party of the Coast and Geodetic Survey.

To Mr. Swepson Earle, hydrographic engineer to the Commission, whose knowledge of the work from former service in the Coast and Geodetic Survey has greatly facilitated his practical use of the technical data furnished by the Government.

And to the many others connected with the Commission or who as residents in the locality where the work was being carried on have greatly assisted by furnishing important information or willing services.

## CHARTS AND MAPS.<sup>1</sup>

### CHARTS OF NATURAL OYSTER BARS.

The charts of the natural oyster bars of Talbot County published by the Coast and Geodetic Survey from results of the surveys of the Government in cooperation with the Maryland Shell Fish Commission consist of seven sheets covering all the oyster-producing waters of that county. They are published on the large scale of 1 part in 20,000 (approximately  $3\frac{1}{16}$  inches to a statute mile) and are constructed on polyconic projections; and all information shown on them is based on the United States standard datum of the Coast and Geodetic Survey.

These charts show all oyster bars and other boundaries established by the Commission, and are certified for the purpose of filing in the office of the clerk of the circuit court of Talbot County and in the office of the Maryland Shell Fish Commission, as required by the oyster laws of Maryland.

In addition to the oyster bar and other boundaries, the charts show the location and name of all landmarks (United States Coast and Geodetic Survey triangulation stations) used in making the survey, together with the hydrography and topography<sup>2</sup> necessary to make the technical definitions and delineations of boundaries readily understandable both by the people engaged in the oyster industry and the general public who may become interested through leasing of barren bottoms for oyster culture.

The names of the oyster bars are those used locally, as nearly as could be ascertained by the hydrographic engineer of the Commission. When there was no local name in common use, a name was selected from one of the prominent features of the vicinity. By the use of recognized names or those that would naturally suggest certain sections of water, it is believed that much confusion will be avoided in the location on the charts of the oyster bars, especially by those not familiar with the use of maps.

The corners of the oyster bars are numbered from 1 to the total number of corners in each area under consideration. Where boundaries adjoin, making one point a corner of two or more oyster bars, these points have two or more numbers, each number corresponding to the bar in which the figure is located. The numbers of the corners correspond with the technical and legal descriptions of this publication under the heading "Boundaries of natural oyster bars."

The landmarks and oyster bars have been grouped in the "Contents" of this publication in accordance with the charts upon which they are shown. To find a particular oyster bar or landmark which is only known by name, consult the "Contents" and

<sup>1</sup> These charts can be obtained by application to the Superintendent of the Coast and Geodetic Survey, at Washington, D. C.

<sup>2</sup> Much of the detail of the inshore topography was obtained from the excellent map of Talbot County, prepared and published by the Maryland Geological Survey under the direction of Dr. William Bullock Clark from surveys of the Maryland Geological Survey in cooperation with the United States Geological Survey.

the desired chart and general location will be indicated. To find the name of a bar or landmark which is only known by location, consult the progress map at the end of this publication for the number of the chart on which it is to be found, and then examine the known locality on the chart for the name of the bar or landmark in question.

The contours on the charts showing the depth of water at mean low tide have been taken from the hydrographic sheets of former work of the Coast and Geodetic Survey. Four curves were selected as being the most convenient for taking off from the original hydrographic sheets and the ones of greatest value to those interested in shell fish industries. The 1-fathom contour (6 feet) and the 5-fathom curve (30 feet) correspond in a general way to the inner and outer limits of all the oyster bars surveyed. The 3-fathom contour (18 feet) furnishes the curve of about the average depth of water on the oyster bars, and the 10-fathom contour (60 feet) serves in a general way to indicate the outer limits of probable oyster culture.

The boundaries of the waters within the "territorial limits of the county" and the boundaries of the "waters contiguous to the county" opened up for the leasing with Talbot County are plainly indicated on the charts. A full technical description of these boundaries is given in this publication under the heading "Boundaries of county waters."

The areas in acres of the oyster bars were determined under the direction of the hydrographic engineer of the Commission by two independent planimeter measurements of the areas as delineated on the smooth projections of the Coast and Geodetic Survey. These areas are given in small figures in parentheses on the face of the chart within the boundaries of the different shell fish bottoms.

The symbols used on the charts for the different kinds of boundaries, triangulation stations, contours of depth of water, etc., require no other explanation than that given in the legend and other notes on the face of the charts.

#### LEASING CHARTS.

The leasing charts of Talbot County, like those for Anne Arundel, Somerset, Wicomico, Worcester, Calvert, Charles, St. Marys, Baltimore, Kent, and Queen Annes Counties, have been prepared under the direction of the hydrographic engineer of the Commission. They are constructed on polyconic projections on the scales of 1 part in 5,000 or 1 part in 10,000, as the needs of oyster culture may require, and the information shown on them is based on the United States standard datum of the Coast and Geodetic Survey.

These charts show all the oyster bars, crab bottoms, and clam beds and other boundaries established by the Commission, and also all boundaries of oyster lots leased for the purpose of oyster culture, thus making them comprehensive and valuable records of the results of the operations of the oyster-culture laws.

The lots leased under the provision of the "old 5-acre law" are frequently of irregular shape, but the lots leased under the provision of the new oyster laws must be of rectangular shape by the terms of that act. For this latter purpose the leasing charts have been divided by parallels of latitude and meridians of longitude into small rectangles of 1 acre or 5 acres, as may be best suited to the area under consideration, and

prospective leaseholders by the rules of the Commission are compelled to select whole rectangles as far as possible.

For reasons of the present changeable nature of the number of lots leased and the large number of charts required, the leasing charts are not likely to be published for some years, but they can be seen at any time on file at the offices of the Commission, in the Marine Bank Building at Baltimore.

#### PROJECTIONS.

The polyconic projections<sup>1</sup> covering Talbot County waters are 14 in number and on the scale of 1 part in 10,000. They were constructed by draftsmen of the Coast and Geodetic Survey, but the sextant positions which determine the location of the legal boundaries of the oyster bars as delineated by the Shell Fish Commission were plotted by the draftsman of the Commission.

A copy of each of these projections, with all the plotted positions of triangulation stations, shore line, sextant positions, and boundaries of oyster bars, was made under the direction of the hydrographic engineer of the Commission by pricking through with a sharp needle the intersections of the projection lines and all other points as plotted on the original sheets.

These projections (in duplicate) are the original records of all oyster bar and other boundaries established by the Commission, one set being filed in the archives of the Coast and Geodetic Survey, at Washington, and the other set in the archives of the Shell Fish Commission.

#### PROGRESS MAPS.

The progress map to be found at the end of this publication is on a scale of 1 part in 100,000, and shows in outline the work accomplished by the United States Coast and Geodetic Survey in Talbot County and contiguous waters. It gives the scheme of all the charts and smooth projections constructed in connection with the survey, the location and names of all triangulation stations used as a basis for the surveying work, and the "boundaries of county waters" established by the Commission for the purpose of carrying out the laws of Maryland relating to oyster culture.

Besides indicating the amount of work done by the Coast and Geodetic Survey in connection with the work of the Shell Fish Commission, this progress map will be of special value for index purposes to engineers and others searching for the particular chart or projection covering the locality of the oyster bars or landmarks that may be under consideration.

The progress maps<sup>2</sup> accompanying the first and second annual reports of the Maryland Shell Fish Commission were prepared under the direction of the hydrographic engineer of the Commission. They are on the scale of 1 part in 400,000, and show the outline of the tide-water counties of Maryland, with shaded areas to indicate the waters already covered by the operations of the oyster survey.

<sup>1</sup> For the scheme of these projections see the progress map at the end of this publication.

<sup>2</sup> These maps and reports can be obtained by application to Maryland Shell Fish Commission, Marine Bank Building, Baltimore, Md.

## BOUNDARIES OF THE COUNTY WATERS.<sup>1</sup>

### WATERS WITHIN TERRITORIAL LIMITS OF COUNTY.

The laws of Maryland relating to oyster culture provide that "no person shall be permitted, by lease, assignment, or in any other manner, to acquire a greater amount of land than ten acres situated within the territorial limits of any of the counties, or one hundred acres in any other place."

The boundary line<sup>2</sup> between the waters "within the territorial limits" of Talbot County and the waters in "any other place," as established by the Shell Fish Commission for the purpose of carrying out the oyster laws, and delineated on the "oyster" charts and the smooth projections of the Coast and Geodetic Survey, is technically described and defined as follows:

Commencing at the head of the oyster-producing waters of Wye River on the channel boundary line between Talbot County and Queen Annes County; thence following the channel boundary line between Talbot County and Queen Annes County down the upper Wye River to a point situated in the vicinity of the eastern end of Wye Island; thence continuing down the channel of the branch of Wye River running south of Wye Island along the boundary line between Talbot County and Queen Annes County, as laid down on "Chart No. 32, Natural Oyster Bars, Maryland," to the mouth of Wye River; thence continuing along the boundary line between Talbot County and Queen Annes County, as laid down on "Chart No. 32, Natural Oyster Bars, Maryland," passing into Miles River in a curved line about half way between Herring Island and Bennett Point and then down Miles River to a point situated about  $1\frac{1}{2}$  miles northeast of Tilghmans Point in the Eastern Bay entrance of Miles River; thence continuing on the boundary line between Talbot County and Queen Annes County in Eastern Bay as laid down on "Charts Nos. 31 and 32, Natural Oyster Bars, Maryland," to a point situated in the Chesapeake Bay entrance of Eastern Bay defined by the intersection of the boundary line between Talbot County and Queen Annes County and a straight line between a point on Kent Point on the southern extremity of Kent Island defined by <sup>3</sup>latitude  $38^{\circ} 50' 05.1''$  and longitude  $76^{\circ} 22' 06.2''$  and a point situated on Wades Point on the eastern side of the entrance of Eastern Bay defined by latitude  $38^{\circ} 49' 34.2''$  and longitude  $76^{\circ} 18' 04.5''$ ; thence in a straight line across the eastern half of the Chesapeake Bay entrance of Eastern Bay to a point on Wades Point defined by latitude  $38^{\circ} 49' 34.2''$  and longitude  $76^{\circ} 18' 04.5''$ ; thence in a southerly direction along the mean low water line or across the mouth of all inlets less than 100 yards in width, as the case may be, of the eastern shore of Chesapeake Bay to a point situated on Lows Point defined by latitude  $38^{\circ} 46' 33.4''$  and longitude  $76^{\circ} 20' 07.4''$ ; thence in a straight line across the northern entrance of Poplar Island Narrows to a point situated on the northern end of Poplar Island defined by latitude  $38^{\circ} 46' 42.8''$  and longitude  $76^{\circ} 22' 25.0''$ ; thence along the mean low water line or across the mouth of all inlets less than 100 yards in width, as the case may be, of the western shore of

<sup>1</sup> For a complete historical and legal description of the boundaries of the counties of Maryland, the valuable publication entitled "The Counties of Maryland—Their Origin, Boundaries, and Election Districts," prepared by Dr. Edward B. Mathews and published by the Maryland Geological Survey under the direction of Dr. William Bullock Clark, superintendent, should be consulted, as the boundaries described in this publication have been established and technically defined for the purpose of carrying out the oyster laws of the State, and may or may not be correct for other purposes.

<sup>2</sup> See "Charts of Natural Oyster Bars," published by the Coast and Geodetic Survey, and the progress map at the end of this publication.

<sup>3</sup> Latitudes and longitudes based on the United States standard datum of the United States Coast and Geodetic Survey.

Poplar Island to a point situated on the southern end of the main part of Poplar Island defined by latitude  $38^{\circ} 45' 17.5''$  and longitude  $76^{\circ} 22' 43.6''$ ; thence in a straight line across an inlet into Poplar Island Harbor to a point situated on the western extremity of the detached part of Poplar Island known as Coaches Neck defined by latitude  $38^{\circ} 45' 08.8''$  and longitude  $76^{\circ} 22' 35.3''$ ; thence along the mean low water line or across the mouth of all inlets less than 100 yards in width, as the case may be, of the western and southern shore of a detached part of Poplar Island known as Coaches Neck to a point situated on its eastern extremity defined by latitude  $38^{\circ} 44' 59.4''$  and longitude  $76^{\circ} 21' 46.5''$ ; thence in a straight line across the southern entrance of Poplar Island Narrows to a point situated on the mainland on Great Marsh Point defined by latitude  $38^{\circ} 44' 56.0''$  and longitude  $76^{\circ} 20' 34.2''$ ; thence in a southerly direction along the mean low water line or across the mouth of all inlets less than 100 yards in width, as the case may be, of the eastern shore of Chesapeake Bay to a point situated on the northern side of the entrance to Front Creek defined by latitude  $38^{\circ} 43' 47.5''$  and longitude  $76^{\circ} 20' 34.0''$ ; thence in a straight line across the Chesapeake Bay entrance of Front Creek and Knapps Narrows to a point situated on the southern side of Chesapeake Bay entrance of Knapps Narrows defined by latitude  $38^{\circ} 43' 14.8''$  and longitude  $76^{\circ} 20' 27.6''$ ; thence in a southerly direction along the mean low water line or across the mouth of all inlets less than 100 yards in width, as the case may be, of the eastern shore of Chesapeake Bay to a point situated on Blackwalnut Point on the northwestern side of the Chesapeake Bay entrance of lower Choptank River defined by latitude  $38^{\circ} 40' 06.6''$  and longitude  $76^{\circ} 20' 24.7''$ ; thence in a straight line ending at a point situated on Cook Point on the southeastern side of the Chesapeake Bay entrance of lower Choptank River defined by latitude  $38^{\circ} 37' 55.7''$  and longitude  $76^{\circ} 17' 28.7''$  to a point on this line defined by its intersection with boundary line in lower Choptank River between Talbot County and Dorchester County as laid down on "Charts Nos. 33, 34, 36, and 37, Natural Oyster Bars, Maryland;" thence along the boundary line in lower Choptank River between Talbot County and Dorchester County as laid down on "Charts Nos. 33, 34, 36, and 37, Natural Oyster Bars, Maryland," to the entrance of upper Choptank River between Castle Haven Point and Island Creek; thence continuing along the boundary line between Talbot County and Dorchester County up the channel of upper Choptank River pass the city of Cambridge around Chancellors Point and pass the town of Choptank, all as laid down on "Chart No. 35, Natural Oyster Bars, Maryland;" thence continuing up the channel boundary line of upper Choptank River between Talbot County and Dorchester County to the head of the oyster-producing waters.

#### WATERS CONTIGUOUS TO COUNTY.

The oyster laws of Maryland provide that a true and accurate delineation of all natural oyster bars shall be made on copies of charts of the United States Coast and Geodetic Survey, "which said copies shall be filed in the office of the said commissioners in the city of Baltimore," and "in the office of the clerks of the circuit courts for the respective counties wherein the grounds so designated may lie."

For the purpose of carrying out the latter part of this section of the law and for the purpose of establishing the limits of the oyster-culture area to be opened up for leasing with each county surveyed, it is necessary for the Shell Fish Commission to establish a boundary line between the waters contiguous to but not within the territorial limits of each county and the waters contiguous to but not within the territorial limits of adjacent counties.

This boundary line has been delineated on the "Charts of Natural Oyster Bars," published by the Coast and Geodetic Survey, and is technically described and defined as follows:

Commencing at a point in the Chesapeake Bay entrance of Eastern Bay defined by the intersection of the boundary line between Talbot County and Queen Annes County, as laid down on "Chart No. 31, Natural Oyster Bars, Maryland," with a straight line across the Chesapeake Bay entrance of Eastern Bay,

*Survey of Oyster Bars, Talbot County, Md.*

defined at its western end by a point situated on the southern extremity of Kent Island in latitude  $38^{\circ} 50' 05.1''$  and longitude  $76^{\circ} 22' 06.2''$  and defined at its eastern end by a point situated on Wades Point on the eastern side of the entrance of Eastern Bay in latitude  $38^{\circ} 49' 34.2''$  and longitude  $76^{\circ} 18' 04.5''$ ; thence along the boundary line between Talbot County and Queen Annes County, passing into Chesapeake Bay between Kent Island and Poplar Island, as laid down on "Chart No. 31, Natural Oyster Bars, Maryland," to a point situated in Chesapeake Bay about  $3\frac{1}{2}$  miles southwest of Bloody Point Bar Light defined by latitude  $38^{\circ} 46' 06.6''$  and longitude  $76^{\circ} 26' 37.1''$ ; thence in a straight line in a southerly direction with Chesapeake Bay to a point situated in Chesapeake Bay about  $3\frac{3}{8}$  miles east of Hog Point and  $5\frac{3}{8}$  miles southwest of Poplar Island, defined by latitude  $38^{\circ} 42' 33.4''$  and longitude  $76^{\circ} 27' 40.0''$ ; thence in a straight line in a southerly direction with Chesapeake Bay to a point situated in Chesapeake Bay about  $5\frac{1}{2}$  miles southwest of Sharps Island Light and  $5\frac{3}{4}$  miles northwest of James Island, defined by latitude  $38^{\circ} 34' 29.6''$  and longitude  $75^{\circ} 26' 17.0''$ ; thence along the boundary line between Talbot County and Dorchester County, passing south of Sharps Island into the Chesapeake Bay entrance of the lower Choptank River, as laid down on "Charts Nos. 33, 36, and 37, Natural Oyster Bars, Maryland," to a point defined by the intersection of this boundary line with a straight line across the entrance of lower Choptank River, defined at its northwestern end by a point situated on Blackwalnut Point in latitude  $38^{\circ} 40' 06.6''$  and longitude  $76^{\circ} 20' 24.7''$  and defined at its southeastern end by a point situated on Cook Point in latitude  $38^{\circ} 37' 55.7''$  and longitude  $76^{\circ} 17' 28.7''$ .<sup>1</sup>

<sup>1</sup> Latitudes and longitudes based on the United States standard datum of the United States Coast and Geodetic Survey.

## LANDMARKS (U. S. COAST AND GEODETIC SURVEY TRIANGULATION STATIONS).

### EXPLANATION.

The oyster laws of Maryland authorizing the survey to be made by the Shell Fish Commission provide for "an accurate report of said survey, setting forth such a description of landmarks as may be necessary to enable the said board, or their successors, to find and ascertain the boundary lines of said natural oyster beds, bars, and rocks, as shown by delineation on the maps and charts." The law of the United States authorizing the cooperation of the Department of Commerce and Labor in the survey of natural oyster bars of Maryland provides for the erection of "such structures as may be necessary to mark the points of triangulation, so that the same may be used for such future work of the Coast and Geodetic Survey as the said bureau may be hereafter required to perform in prosecuting the Government coast survey of the navigable waters of the United States located within the State of Maryland."

Under the provisions of the sections of the laws stated above, the markings and descriptions of landmarks must be sufficient for the present and future needs of both the Government and the State. With this end in view, considerable work has been expended in erecting permanent monuments at the triangulation stations and in the proper description of their location.

An effort has been made to arrange the descriptions of location and character of landmarks in a uniform and logical manner. The descriptions start with the assumption that the individual seeking a landmark has only an indefinite idea of its location. They gradually proceed from description of the general locality of a landmark to the descriptions of its immediate surroundings. This is followed by specific details of the character of the center and reference marks and a "round" of reference angles and distances which in themselves frequently contain enough information to furnish an independent and reliable location of the triangulation station.

### METHOD OF DESCRIBING TRIANGULATION STATIONS.

*The separate descriptions of triangulation stations should not be used without reading the following explanation of the method of describing the triangulation stations, as it contains certain details that are common to all the landmarks described in this publication and which are omitted in the separate descriptions as being needless repetitions:*

*Name.*—The title at the top of each separate description is the name by which the landmark or triangulation station is known and designated in all work and published oyster records or oyster charts of both the Government and State. The selection of the name is usually left to the triangulator establishing the station, and it may or may not have geographic or other significance in reference to the locality.

*General locality.*—Under this heading is given the general locality of the landmark in reference to well-known and prominent natural or artificial features, such as the nearest body of water, town, river, steamer wharf, well-defined point of land, church, or any other feature that is likely to remain both permanent and prominent.

This heading also covers a reference to the published chart or map which shows the location of the station most clearly. Nearly all the triangulation stations described in this publication are plainly indicated by name and a triangulation symbol on the published charts of oyster bars of Maryland. In this case they are referred to by serial number only, the words "charts of oyster bars of Maryland" being omitted to avoid needless repetition. These published oyster charts are on the large scale of 1 part in 20,000 (approximately  $3\frac{1}{8}$  inches to a statute mile) and show the locations of the triangulation stations so clearly that in many cases the written descriptions will not be required to find them.

*Immediate locality.*—Under this heading is given the description of the "observed station" in reference to its immediate surroundings. This is supposed to include a statement of the station's estimated elevation above high water or some other well-defined level of the locality, such as a road or house; the character of the ground on which it is located, such as marsh land, sand beach, cultivated field, or meadow; estimated bearings in points of the compass and estimated distances in yards *from* (not to) easily recognized features, such as extreme end of point, edge of bluff, bank of creek, line of telephone poles, shore line, barn, house, fence, ditch, trees, or any other definite detail, such as being on range with the tangent of an island and a church, etc.

When a standard monument has been established near the station as a "reference station," this heading also covers a statement of the true bearing of the monument in degrees and minutes and its measured distance in meters, as it is the first object that is likely to catch the eye when the immediate vicinity of the desired station is reached and might be mistaken for the center mark of the "observed station" unless special attention is called to it.

The distinction between the "observed station" and "reference station" should be carefully noted by anyone making use of the description of stations for any future surveying operations.

The "observed station" is located at the particular triangulation point covered by the description of stations, and is the one whose geographic position is first computed, as it is the point which was "occupied" and "observed on" for horizontal angles. However, in spite of the primary importance of the location of the "observed station," it will be noted from the description of stations that frequently it is not marked as well as the "reference station," and in some instances has only a pine stub to indicate its position. This is the case for the reason that the necessity of intervisibility of landmarks usually made it compulsory to locate "observed stations" on edges of banks and ends of points of land, which in the tide-water section of Maryland generally means they will be washed away in a short period of years. The past experience of the Coast and Geodetic Survey in this region has shown the great need of "reference stations," if the frequent reestablishment of a new framework of triangulation is to be avoided.

The chief reason and need for the establishment of the "reference station," or secondary station, as it might be well named, is explained in the preceding paragraph,

but in several instances other reasons, such as the location of the "observed station" on an unstable sand dune, in a cultivated field, in front of a residence, or other places objectionable to the landowner, have led to establishment of "reference stations." The location of the "reference station" in relation to the "observed station" is fixed for plotting on charts or for computation of its geographic position by checked measurements of its distances and azimuth from the "observed station."<sup>1</sup>

*Marks.*—Under this heading is given a description of the character of the permanent monuments or other marks of the location of the "observed station," and of the "reference station" where one has been established.

All the marks designated in the descriptions as "the center point of triangle on standard cement monument" are exactly alike. These monuments are made of cement, sand, and gravel, and are 2 feet long and 8 inches square at top and bottom. Their tops are all marked with the same brass mold and show a center hole surrounded by a triangle, with the letters "M. S. F. C." arranged around the vertex and the letters "U. S. C. S." underneath the base of the triangle. The center hole is always in the center of the top of the monument by construction, and if this is found to have been broken off without disturbing the bottom, the center of its square section can be used as the location of the station.

All the "standard cement monuments," whether used for marking the "observed station" or "reference station," have been planted upright in exactly the same manner, with their tops projecting 3 or 4 inches above the surface of the ground, unless otherwise stated.

Therefore, as the above facts in reference to the "standard cement monuments" are a constant element in all cases, the repetition of these facts in the description of stations is made needless by this one statement.

*References.*—Under this heading are given the "rounds" of directions and distances to all objects that might be useful in locating the stations when the surface marks can not be found. It is also contemplated that for general purposes of topography, hydrography, or location of boundaries of oyster bars these references will be sufficient in many cases to relocate the position of an "observed station" or "reference station" when both of them have been destroyed.

The first reference object given in the descriptions is always a triangulation station visible from the station being described, this, if possible, being a lighthouse, church spire, or other permanent and prominent point. Its direction is taken as being  $0^{\circ} 00' 00''$ , and the directions of all other objects are measured from it as an initial point, the angles being taken in a clockwise direction (left to right).

The true bearing<sup>2</sup> of the initial object is always given in parentheses alongside its name. This furnishes means for the calculation of the bearings of any of the other reference objects for the purposes of locating a station by horizontal angles or for the relocation of corner buoys of oyster-bar boundaries by the method of compass directions described in this publication under the heading of "Boundaries of oyster bars."

<sup>1</sup> Geographic coordinates (latitude, longitude, distance, and azimuth) relating to any of the "observed stations" or of the "reference stations" described in this publication can be obtained by application to the Superintendent of the Coast and Geodetic Survey, at Washington, D. C.

<sup>2</sup> The mean magnetic variation for Talbot County was  $6^{\circ} 10'$  west of north in 1911 and increasing at the rate of  $5'$  yearly.

The distances in the last column under "References" are given in three different units, which vary according to their accuracy. The "miles" are statute miles, and may be considered only as rough estimates. The "yards" are more accurate, but must be looked on as results generally obtained by pacing or careful estimating. The "meters," however, are accurate to the degree indicated by their decimals and in every case have been measured with a steel tape. In the same manner, the accuracy of the directions are indicated by the refinement of angular measure with which they are recorded.

## THOMAS POINT SHOAL LIGHT.

*General locality.*—Western side of Chesapeake Bay offshore about  $1\frac{1}{4}$  miles southeast of Thomas Point and 3 miles south of entrance to channel to Annapolis. (See Chart No. 31.)

*Immediate locality.*—Observed station is on a hexagonal screw-pile structure known as Thomas Point Shoal Lighthouse.

*Marks.*—Observed station is center point of lantern on Thomas Point Shoal Lighthouse.

*References.*—

"Thomas 3" (N  $56^{\circ} 07' W$ )..... 0 00 00 .....  $1\frac{1}{4}$  miles.

## BLOODY POINT BAR LIGHT.

*General locality.*—Offshore of southwestern end of Kent Island on northern side of entrance to Eastern Bay about  $1\frac{1}{2}$  miles southwest of Bloody Point and  $1\frac{1}{4}$  miles west of Kent Point. (See Chart No. 31.)

*Immediate locality.*—Observed station is on tower on caisson structure known as Bloody Point Bar Lighthouse.

*Marks.*—Observed station is center point of lantern on Bloody Point Bar Lighthouse.

*References.*—

"Valiant" (S  $4^{\circ} 59' E$ )..... 0 00 00 .....  $4\frac{1}{2}$  miles.

## TENK.

*General locality.*—Northern side of entrance to Eastern Bay on Kent Point about  $1\frac{1}{2}$  miles east of Bloody Point Bar Light. (See Chart No. 31.)

*Immediate locality.*—Observed station is in about 2 feet of water 18 yards offshore of Kent Point, 50 yards southwest of point of land, and 65 yards south-southeast of another point of land. Cement monument marking reference station is 35.94 meters N  $36^{\circ} 15' W$  of observed station.

*Marks.*—Observed station is nail in center of 3-inch square stub in water with top about on level with high water. Reference station is center point of triangle on standard cement monument projecting 6 inches above surface of ground.

*References.*—

## BATTS.

*General locality.*—Northern shore of Eastern Bay on southern end of Batts Neck between Shipping and Cox Creeks about 1¼ miles northwest of Turkey Point. (See Chart No. 31.)

*Immediate locality.*—Observed station is in cultivated field about 2 feet above high water, 21 yards north of shore, and 100 yards west of a wire fence extending 100 yards into bay.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 6 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument. Station "COXES CREEK," 1899, is 87.70 meters N 72° 20' E of observed station and is marked by the center of a cross in the top of a granite post about 12 inches square in the rough and about 27 inches long projecting 5 inches above surface of ground. The top of the granite post is dressed to a 6-inch cube marked with a square cross and the letters U. S. Subsurface mark is center of neck of a bottle buried with top 3 inches below base of granite post.

## RICH NECK WATER TANK.

*General locality.*—On neck of land about halfway between Eastern Bay and Miles River about 1¾ miles south-southwest of Tilghmans Point. (See Charts Nos. 31 and 32.)

*Immediate locality.*—Observed station is on large water tank on steel tower on Rich Neck Farm.

*Marks.*—Observed station is spindle on center of water tank.

*References.*—

None necessary.

## KEMP TOWER.

*General locality.*—Southern shore of Eastern Bay on Wades Point about 1 mile southwest of Claiborne Wharf and 5½ miles east of Bloody Point Bar Light. (See Chart No. 31.)

*Immediate locality.*—Observed station is on tower or cupola of Wades Point Hotel, which is a large, square, frame structure adjoining a brick house.

*Marks.*—Observed station is center of top of roof of cupola.

*References.*—

None necessary.

## KEMP.

*General locality.*—Southern shore of Eastern Bay on Wades Point about 1¾ miles southwest of Claiborne Wharf and 4¾ miles east by south of Bloody Point Bar Light. (See Chart No. 31.)

*Immediate locality.*—Observed station is in cultivated land about 8 feet above high water, 30 yards east by north of a wire fence and several trees, 55 yards south-southeast of edge of bank, 90 yards east-northeast of a bungalow, 130 yards north by west of a wire and wood fence corner, 130 yards north-northwest of wooden fence, and 400 yards west by south of Wades Point Hotel.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 6 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## Survey of Oyster Bars, Talbot County, Md.

## PARSONS.

*General locality.*—In northern side of Eastern Bay on western side of Parsons Island about 3 miles north of Tilghmans Point. (See Chart No. 32.)

*Immediate locality.*—Observed station is in cultivated land on highest part of island about 15 feet above high water, 110 yards southeast of shore, 270 yards south-southwest of Parsons Island water tank, 350 yards southwest of a house, 380 yards west-southwest of a large barn, 145 yards northeast of a wire fence, 155 yards northwest of wire fence at farm road, 195 yards southeast of a fence, and on the range of the west edge of the south chimney on the lower gable of the house with the west side of a window in the center of the south side of the house. Cement monument marking reference station is 26.10 meters N 21° 43' E of observed station.

*Marks.*—Observed station is center of cross cut on rough granite stone about 35 inches long and 12 inches square with top cut to 6-inch cube and marked "U. S." in lower half of cross. Subsurface mark is the mouth of a bottle 3 inches below base of monument. Reference station is center point of triangle on standard cement monument with top 5 inches above the surface of the ground.

## PARSONS ISLAND WATER TANK.

*General locality.*—Northern part of Eastern Bay between Crab Alley and Prospect bays on Parsons Island about half way between the north and south end of the island. (See Chart No. 32.)

*Immediate locality.*—Observed station is on a water tank on wooden structure near a house.

*Marks.*—Observed station is center of spindle on center of water tank.

*References.*—

None necessary.

## NORMAN.

*General locality.*—Eastern shore of Crab Alley Bay on southwestern extremity of Crab Alley Neck about ¼ mile west of Normans Point, 2 miles northeast of Turkey Point, and ⅜ mile northwest of Parsons Island. (See chart No. 32.)

*Immediate locality.*—Observed station is in a cultivated field on a rapidly washing, narrow neck of land, about 6 feet above high water, 20 yards north of vertical bank at shore, 30 yards south of vertical bank at shore, and 40 yards northeast of extreme end of point.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 3 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## NOSE.

*General locality.*—Western shore of the branch of Wye River bounding Wye Island on the west on a point about ⅝ mile north-northwest of Bruffs Island. (See Chart No. 32.)

*Immediate locality.*—Observed station is on a marsh point about 1 foot above high water, 4 yards southwest of shore. 6 yards north of shore, 14 yards west-northwest of extreme end of point, and 34 yards east of a row of locust trees.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 5 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## SNOUT.

*General locality.*—On Wye Island on the eastern shore of the branch of Wye River, bounding Wye Island on the west about ¾ mile north of Bruffs Island and ½ mile north of Bordley Point. (See Chart No. 32.)

*Immediate locality.*—Observed station is in cultivated land about 12 feet above high water, 30 yards east by south of edge of bank, 65 yards south of large cherry tree in side of bank at fence, 65 yards southwest of rail fence, 70 yards northeast of a small clump of trees at edge of bank, and 400 yards west by north of a house.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 5 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

Nail in blaze in oak tree (4 inches diameter)..	349	37	20	20.87 meters.

## WHEEL.

*General locality.*—On Wye Island on the northern shore of the branch of Wye River bounding Wye Island on the south on a point about  $\frac{3}{8}$  mile southeast by east of entrance to Granary Creek and  $\frac{1}{2}$  mile northwest of entrance to Pickerings Creek. (See Chart No. 32.)

*Immediate locality.*—Observed station is on marsh point south of woods, about 1 foot above high water, 2 yards east of shore, 4 yards southeast of point at slight cut in marsh, and 40 yards north of square point of shore. Cement monument marking reference station is 5.26 meters S  $86^{\circ} 47'$  E of observed station.

*Marks.*—Observed station is nail in center of 2-inch cedar stub set in 2-inch tile pipe projecting 3 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of surface pipe. Reference station is center point of triangle on standard cement monument projecting 5 inches above surface of ground.

## COLONEL.

*General locality.*—Southern shore of Shaw Bay on a point at entrance to a small cove about  $\frac{1}{2}$  mile from the branch of Wye River bounding Wye Island on the south and  $\frac{3}{8}$  mile east of Bruffs Island. (See Chart No. 32.)

*Immediate locality.*—Observed station is in a field about 10 feet above high water, 6 yards southeast of edge of bank which is washing away, 9 yards south-southwest of point of bank, and 3 yards west of top of bank lined with cedar, walnut, and oak trees. Cement monument marking reference station is 18.69 meters S  $24^{\circ}$  06' E of observed station.

*Marks.*—Observed station is nail in center of 2-inch stub projecting 4 inches above 2-inch tile pipe with top flush with surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of surface pipe. Reference station is center point of triangle on standard cement monument projecting 4 inches above surface of ground.

## BRUFFS.

*General locality.*—Eastern shore of Wye River on northwest point of Bruffs Island about 3/8 mile northeast of Bennett Point and 1/2 mile southwest of Bordley Point. (See Chart No. 32.)

*Immediate locality.*—Observed station is on a marsh point about 1 foot above high water, 10 yards east of shore, 14 yards southwest of shore, 20 yards southeast of point of marsh, and 18 yards west of point of woods.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 7 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## LAW.

*General locality.*—Southeastern shore of Wye River about 3/4 mile east of Bennett Point and 1/8 mile southwest of south end of Bruffs Island. (See Chart No. 32.)

*Immediate locality.*—Observed station is in cultivated land about 15 feet above high water, 8 yards southeast of edge of a bluff, 45 yards southwest of a wire fence, 100 yards northeast of a clump of trees, and 150 yards northwest of a black walnut tree at edge of field.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 4 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## JAMES (MILES RIVER).

*General locality.*—Eastern shore of Miles River at southern side of entrance to Wye River, about ¾ mile southwest of Bruffs Island and ⅝ mile southeast of Bennett Point. (See Chart No. 32.)

*Immediate locality.*—Observed station is in a cultivated field about 20 feet above high water, 17 yards east of edge of a bluff at shore, and 14 yards south of edge of a bluff 18 feet high, with uniform slope to shore.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 6 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## FRANK.

*General locality.*—Eastern shore of Miles River about ½ mile south of entrance to Wye River and 1 mile northeast of Herring Island. (See Chart No. 32.)

*Immediate locality.*—Observed station is in cultivated field about 18 feet above high water, 8 yards east of a bluff washed by high water, and 125 yards south of a ditch. Cement monument marking reference station is 25.51 meters S 87° 47' E of observed station.

*Marks.*—Observed station is center of 2-inch tile pipe projecting 2 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of surface pipe. Reference station is center point of triangle on standard cement monument projecting 4 inches above surface of ground.

## OLLIE.

*General locality.*—Eastern shore of Miles River about 1 mile north of entrance to Leeds Creek, and  $\frac{3}{4}$  mile northeast of Deep Water Point. (See Chart No. 32.)

*Immediate locality.*—Observed station is in woods about 8 feet above high water, 6 yards west of edge of bank which is washing rapidly, and 8 yards northeast of large pine tree at edge of bank. Cement monument marking reference station is 14.42 meters N  $74^{\circ} 15'$  W of observed station.

*Marks.*—Observed station is center of 2-inch tile pipe with top flush with surface of ground. Sub-surface mark is center of 2-inch tile pipe buried with top 2 inches below base of surface pipe. Reference station is center point of triangle on standard cement monument projecting 4 inches above surface of the ground.

## SWING.

*General locality.*—Eastern shore of Miles River about  $\frac{1}{4}$  mile northwest of entrance to Leeds Creek. (See Chart No. 32.)

*Immediate locality.*—Observed station is on marsh land between river and small pond about 4 yards east of shore, 18 yards west of pond, 100 yards south of point of woods, and 100 yards northwest of another point of woods. Cement monument marking reference station is 54.35 meters N  $62^{\circ} 04'$  E of observed station.

*Marks.*—Observed station is center of 2-inch tile pipe with top flush with surface of ground. Sub-surface mark is center of 2-inch tile pipe buried with top 2 inches below base of surface pipe. Reference station is center point of triangle on standard cement monument projecting 5 inches above surface of ground.

## EASTON.

*General locality.*—Southeastern side of Miles River on southeastern approach to Miles River Bridge. (See Chart No. 32.)

*Immediate locality.*—Observed station is on southwest side of cribwork retaining a shell road, 6 inches from downstream edge of cribwork, 7 yards southwest of upstream edge of cribwork, 25 yards southeast of corner of cribwork abutment, 30 yards northwest of extended line of Henderson sea wall, 9 yards southwest by south of nails in side of telephone pole on upstream side of bridge, and 45 yards northwest by west of first telephone pole southeast of bridge on northeastern side of road.

*Marks.*—Observed station is spindle, 1 inch diameter, on top of 3-inch square timber.

*References.*—None necessary.

## HENDERSON.

*General locality.*—Southeastern shore of Miles River on a point about  $\frac{1}{4}$  mile southwest of Miles River Bridge. (See Charts Nos. 32 and 34.)

*Immediate locality.*—Observed station is on a hard marsh point about 1 foot above high water, 6 yards southeast of shore, 8 yards south of shore, 13 yards east of shore, 23 yards north-northeast of point of higher land, and 15 yards north of trees along bank.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 4 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## ST. MICHAELS WATER TANK.

*General locality.*—Western side of Miles River in town of St. Michaels, on north side of Railroad Avenue, near African M. E. Church. (See Charts Nos. 32 and 34.)

*Immediate locality.*—Observed station is on top of a 60,000-gallon water tank on a steel tower 90 feet high.

*Marks.*—Observed station is spindle on center of top of water tank.

*References.*—None necessary.

## MILLWIND.

*General locality.*—Western shore of Miles River at south side of entrance to Long Haul Creek, about ¾ mile northeast of St. Michaels Water Tank and ½ mile south of Deep Water Point. (See Chart No. 32.)

*Immediate locality.*—Observed station is on edge of cultivated field about 8 feet above high water, 2 yards west of edge of bank, 17 yards south of edge of bluff, and 18 yards south by west of junction of bush-covered bank and washed bank.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 5 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## POPLAR SOUTH.

*General locality.*—Eastern side of Chesapeake Bay on Poplar Island on a point of land at southern side of Poplar Island Harbor. (See Chart No. 33.)

*Immediate locality.*—Observed station is on a sandy marsh about 1 foot above high water, 7 yards west-southwest of shore of harbor, 16 yards east-northeast of bay shore, 60 yards north-northwest of extreme point of largest one of the group of islands known as Poplar Island, and 11 yards north of a lone pine tree.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 4 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## GREAT.

*General locality.*—Eastern shore of Chesapeake Bay on Great Marsh Point about 1 mile east of south-east end of Poplar Island. (See Chart No. 33.)

*Immediate locality.*—Observed station is on marsh point about 2 feet above high water, 40 yards east of shore, 40 yards southeast of shore, 50 yards northeast of shore, and 250 yards from woods.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 5 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## FRONT.

*General locality.*—Eastern shore of Chesapeake Bay about ¼ mile north of entrance to Front Creek, 7/8 mile north of Knapps Narrows, and 1½ miles southeast of southeast end of Poplar Island. (See Chart No. 33.)

*Immediate locality.*—Observed station is about 3 feet above high water, 13 yards north-northeast of shore, 18 yards southeast of shore, 25 yards east of extreme end of point, and near several dead trees.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 5 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## SOUTHERN M. E. CHURCH.

*General locality.*—Eastern shore of Chesapeake Bay on Tilghman Island about 1¾ miles north of Blackwalnut Point and 2 miles south of Knapps Narrows. (See Chart No. 33.)

*Immediate locality.*—Observed station is about ¼ mile inshore from Chesapeake Bay on west side of main road on building known as the St. Johns Chapel (Southern M. E. Church).

*Marks.*—Observed station is center of bell cupola on church.

*References.*—None necessary.

## BLACK.

*General locality.*—Eastern shore of Chesapeake Bay on Blackwalnut Point at north side of entrance to Choptank River about 2¾ miles northeast of Sharps Island Light. (See Charts Nos. 33 and 36.)

*Immediate locality.*—Observed station is in cultivated land about 8 feet above high water, 35 yards east-northeast of edge of bank, 45 yards west of edge of bank, 65 yards northwest of edge of bank, and 130 yards south of a lone apple tree.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 5 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## BAR.

*General locality.*—Western shore of entrance to Harris Creek on Upper Bar Neck Point about 1¾ miles north-northeast of Blackwalnut Point and 1½ miles south-southeast of Tilghman Island Wharf. (See Chart No. 33.)

*Immediate locality.*—Observed station is in cultivated field about 6 feet above high water, 3 yards west of edge of bank, and 60 yards north of line of trees at edge of marsh. Cement monument marking reference station is 45.81 meters S 83° 00' W of observed station, nearly on line to large lone persimmon tree 15 inches diameter.

*Marks.*—Observed station is center of 4-inch tile pipe with top about 6 inches below surface of ground. Reference station is center point of triangle on standard cement monument projecting 6 inches above surface of ground.

## M. E. CHURCH.

*General locality.*—Eastern shore of Chesapeake Bay on Tilghman Island, about 2¾ miles north of Blackwalnut Point and ¾ mile south of Knapps Narrows. (See Chart No. 33.)

*Immediate locality.*—Observed station is on main road about halfway between the shores of Chesapeake Bay and Harris Creek, about ¼ mile east of Tilghman Island Wharf on building known as Tilghman Island M. E. Church.

*Marks.*—Observed station is center of small square cupola on church.

*References.*—None necessary.

## AVALON.

*General locality.*—Western shore of Harris Creek on Tilghman Island on point about 100 yards north of shore end of Tilghman Island Wharf. (See Chart No. 33.)

*Immediate locality.*—Observed station is on marsh and clay point, about 1 foot above high water, 9 yards south of shore, 12 yards northwest of shore, 20 yards north-northwest of northeast corner of a house, about 1 yard east of produced line of end of house, 10 yards north of 2 pine trees, and 6 yards north-northwest of bank.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 6 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## SCHOOLHOUSE CUPOLA.

*General locality.*—Eastern shore of Chesapeake Bay on Tilghman Island about 3 miles north of Blackwalnut Point and  $\frac{1}{2}$  mile south of Knapps Narrows. (See Chart No. 33.)

*Immediate locality.*—Observed station is on main road about halfway between the shores of Chesapeake Bay and Harris Creek about  $\frac{3}{8}$  mile northwest of Tilghman Island Wharf on schoolhouse building.

*Marks.*—Observed station is center of bell cupola on schoolhouse.

*References.*—None necessary.

## PEOPLES CHAPEL.

*General locality.*—Eastern shore of Chesapeake Bay on Tilghman Island about  $3\frac{1}{4}$  miles north of Blackwalnut Point and  $\frac{1}{4}$  mile south of Knapps Narrows. (See Chart No. 33.)

*Immediate locality.*—Observed station is in the town of Tilghman about  $\frac{1}{2}$  mile north of Tilghman Island Wharf on building known as Peoples Chapel.

*Marks.*—Observed station is center of small square cupola on chapel.

*References.*—None necessary.

## NARROWS.

*General locality.*—Western shore of Harris Creek about  $\frac{1}{4}$  mile northeast of east entrance to Knapps Narrows, and  $1\frac{1}{4}$  miles west of Change Point. (See Chart No. 33.)

*Immediate locality.*—Observed station is in cultivated field back of a fringe of trees about 6 feet above high water, 45 yards west-northwest of shore, 15 yards west-northwest of edge of field, 90 yards south-southwest of corner of field, and 145 yards northeast of a point of bank where wire fence meets trees.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 5 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## BRIARY.

*General locality.*—Western shore of Harris Creek, on a point at northeastern side of entrance to Briary Cove, about  $\frac{3}{8}$  mile west of Little Neck Point. (See Chart No. 33.)

*Immediate locality.*—Observed station is on a marsh point about 10 yards from extreme end of point.

*Marks.*—Observed station is center of 3-inch cedar stub projecting 8 inches above surface of ground.

*References.*—

NOTE.—This station was established in 1900 and was not reoccupied or re-marked during oyster survey, although relocated by concluded angles.

## VINE.

*General locality.*—Western shore of Harris Creek about  $\frac{1}{4}$  mile north-northwest of Little Neck Point. (See Charts Nos. 33 and 34.)

*Immediate locality.*—Observed station is in cultivated field about 7 feet above high water, 6 yards northwest of shore, and 3 yards northwest of top of vertical bank. Cement monument marking reference station is 15.86 meters N 67° 54' W of observed station.

*Marks.*—Observed station is center of 2-inch tile pipe projecting 4 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of surface pipe. Reference station is center point of triangle on standard cement monument projecting 5 inches above surface of ground.

DAN.

*General locality.*—Eastern shore of Harris Creek on Little Neck Point about 3/4 mile east-northeast of Smith Point. (See Charts Nos. 33 and 34.)

*Immediate locality.*—Observed station is on narrow neck of oyster shells, about 35 yards east of south-west corner of McQuay's oysterhouse, 60 yards east of the extreme west end of point, 25 yards west of bank at edge of woods, and 3 yards south of shell path to oysterhouse. Cement monument marking reference station is 21.37 meters S 69° 28' E of observed station.

*Marks.*—Observed station is center of 2-inch tile pipe projecting 5 inches above surface of ground. Reference station is center point of triangle on standard cement monument projecting 4 inches above surface of ground.

## DOG.

*General locality.*—Eastern shore of Cummings Creek about ¾ mile north of Harris Creek. (See Chart No. 34.)

*Immediate locality.*—Observed station is on marsh about on level with high water, and 16 yards west of clump of myrtle bushes. Cement monument marking reference station is 14.43 meters S 65° 30' E of observed station.

*Marks.*—Observed station is center of 2-inch tile pipe projecting 3 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of surface pipe. Reference station is center point of triangle on standard cement monument projecting 5 inches above surface of ground.

## BOZMAN M. E. CHURCH SPIRE.

*General locality.*—Southeastern shore of Harris Creek in the town of Bozman, on the northwest side of county road leading to Neavitt. (See Chart No. 34.)

*Immediate locality.*—Observed station is on edifice known as Bozman M. E. Church.

*Marks.*—Observed station is center of spire on Bozman M. E. Church.

*References.*—None necessary.

## KOOT.

*General locality.*—Southeastern shore of Harris Creek on a point of land between two coves, about  $\frac{3}{8}$  mile southeast of entrance to Cummings Creek, and  $\frac{1}{2}$  mile west of town of Bozman. (See Chart No. 34.)

*Immediate locality.*—Observed station is in cultivated field about 6 feet above high water, 10 yards south of shore, 6 yards south of edge of bank 6 feet high, and 200 yards north of a graveyard.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 5 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

*References.*—

## NELSON 3.

*General locality.*—Northern shore of Choptank River on Nelson Island, between the entrances to Harris and Broad Creeks. (See Chart No. 34.)

*Immediate locality.*—Observed station is on southwest point of island on marsh about 2 feet above high water, 28 yards north-northeast of extreme end of point, 45 yards northwest of edge of marsh, and 14 yards east of marsh. Cement monument marking reference station is 32.27 meters N 32° 05' E of observed station.

*Marks.*—Observed station is center of nail in 3-inch square stub in tile pipe flush with ground. Reference station is center point of triangle on standard cement monument projecting 6 inches above surface of ground.

ANNETTE.

*General locality.*—Western shore of Broad Creek about  $\frac{3}{4}$  mile north of Nelson Point, and on south side of entrance to Balls Creek. (See Chart No. 34.)

*Immediate locality.*—Observed station is on marsh about 1 foot above high water, and 4 yards west of shore. Cement monument marking reference station is 9.39 meters N  $75^{\circ} 59'$  W of observed station.

*Marks.*—Observed station is center of 2-inch tile pipe projecting 4 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of surface pipe. Reference station is center point of triangle on standard cement monument projecting 3 inches above surface of ground.

## CABIN.

*General locality.*—Eastern shore of Grace Creek about  $\frac{1}{2}$  mile north of Broad Creek entrance to creek. (See Chart No. 34.)

*Immediate locality.*—Observed station is on west gable of deserted cabin about 10 feet above high water, and 17 yards east of shore.

*Marks.*—Observed station is a twenty-penny wire nail driven 2 feet below the peak of west gable of a deserted cabin, and surmounted by a staff erected over nail.

*References.*—None necessary.

## SKINNER.

*General locality.*—Western shore of Broad Creek at eastern side of entrance to Grace Creek, about  $\frac{3}{4}$  mile west of Mulberry Point. (See Chart No. 34.)

*Immediate locality.*—Observed station is on marsh point about 1 foot above high water, 3 yards north-east of shore, 42 yards east of the extreme end of point, and 40 yards southwest of a small clump of trees.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 4 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## BALD.

*General locality.*—Western shore of Broad Creek on Mulberry Point on northern side of entrance to Leadendam Creek. (See Chart No. 34.)

*Immediate locality.*—Observed station is on marsh point about 1 foot above high water, 2 yards north of shore, 50 yards west of extreme east end of point, and 40 yards southeast of a rail fence. Cement monument marking reference station is 16.84 meters N 40° 26' W of observed station. Cedar stub marking old triangulation station "Mulberry" is 22.46 meters N 52° 57' E of observed station.

*Marks.*—Observed station is center of 2-inch tile pipe projecting 7 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of surface pipe. Reference station is center point of triangle on standard cement monument projecting 4 inches above surface of ground. Old triangulation station "Mulberry" is nail in 2-inch cedar stub projecting 2 inches above surface of ground.

## BENGAL.

*General locality.*—Western shore of upper Broad Creek about  $\frac{3}{4}$  mile west of north end of Hambleton Island. (See Chart No. 34.)

*Immediate locality.*—Observed station is on narrow marsh point about 1 foot above high water, 4 yards south of shore, 55 yards west of extreme end of point, and north of a fringe of pine and cedar trees along bank. Cement monument marking reference station is 8.81 meters S 52° 34' W of observed station.

*Marks.*—Observed station is center of 2-inch tile pipe projecting 3 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of surface pipe. Reference station is center point of triangle on standard cement monument projecting 5 inches above surface of ground.

## MARION.

*General locality.*—Western shore of upper Broad Creek about 2½ miles northwest of Hambleton Island. (See Chart No. 34.)

*Immediate locality.*—Observed station is on east side of a tenant house in a cultivated field about 8 feet above high water, 12 yards south of shore, and 12 yards northwest of old open well.

*Marks.*—Observed station is center of hole drilled in east face of center one of three posts supporting east front of a tenant house, and surmounted by spindle erected over hole.

*References.*—None necessary.

## WILLIS.

*General locality.*—Eastern shore of upper Broad Creek, on a point at northern side of entrance to a small creek about 2½ miles west of St. Michaels. (See Chart No. 34.)

*Immediate locality.*—Observed station is on marsh point at west edge of yard of a house about 1 foot above high water, 8 yards east of shore, 5 yards west of top of slope, about 4 feet higher than station, and 65 yards southwest of the southwest corner of a house.

*Marks.*—Observed station is center of 2-inch tile pipe projecting 6 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of surface pipe.

## ANSLEY.

*General locality.*—Eastern shore of Back Creek, about 1 mile south of St. Michaels, ½ mile northeast of north end of Hambleton Island, and ½ mile south of entrance to a small creek. (See Chart No. 34.)

*Immediate locality.*—Observed station is on marsh point about 1 foot above high water, 3 yards south of shore and in center of triangle formed by three pine stubs driven flush with marsh to support theodolite. Cement monument marking reference station is 21.25 meters N 71° 13' E of observed station.

*Marks.*—Observed station is center of 2-inch tile pipe projecting 4 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of surface pipe. Reference station is center point of triangle on standard cement monument.

## CREEK.

*General locality.*—Northeastern shore of Choptank River on east side of entrance to Irish Creek, about  $\frac{5}{8}$  mile east-northeast of Royston Island. (See Chart No. 34.)

*Immediate locality.*—Observed station on marsh point about 1 foot above high water, 11 yards south-east of shore, 11 yards east of shore, 17 yards north-northeast of shore and 14 yards south of cut in shore.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 5 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## BENONI 2.

*General locality.*—Northern shore of Choptank River on Benoni Point at western side of entrance to Tred Avon River, about 1 $\frac{3}{8}$  miles northwest of Choptank River Light. (See Chart No. 34.)

*Immediate locality.*—Observed station is about 5 feet above high water, 9 yards south-southwest of foot of knoll and edge of marsh, 4 yards northeast of edge of bank, 25 yards east-southeast of point of bank, 30 yards north by west of point of marsh, and 100 yards southwest of a cove. Cement monument marking reference station is 7.45 meters N 42° 02' E of observed station.

*Marks.*—Observed station is nail in center of stub projecting 4 inches above a 4-inch tile pipe with top of pipe flush with surface of ground. Reference station is center point of triangle on standard cement monument projecting 4 inches above surface of ground.

TRED.

*General locality.*—Western shore of Tred Avon River about  $\frac{1}{2}$  mile west of Oxford. (See Chart No. 34.)

*Immediate locality.*—Observed station is about on level with high water, 2 yards west of shore of marsh strip, 6 yards east of foot of a bank, 6 feet high, 30 yards south by east of small house among trees, 13 yards south by east of end of fence, and 20 yards north of small point of marsh strip. Cement monument marking reference station is 4.98 meters N 68° 24' W of observed station and at foot of bank.

*Marks.*—Observed station is nail in center of cypress stub projecting 5 inches above 4-inch tile pipe with top of pipe flush with surface of ground. Reference station is center point of triangle on standard cement monument projecting 5 inches above surface of ground.

## PLAIN.

*General locality.*—Western shore of Tred Avon River about ½ mile west of north side of entrance to Trippe Creek, and 1¾ miles south-southwest of Double Mills wharf. (See Chart No. 34.)

*Immediate locality.*—Observed station is in cultivated land about 3 feet above high water, 5 yards southwest of shore, 10 yards west of shore at first water bush, and 150 yards northwest of point of shore. Cement monument marking reference station is 17.90 meters S 55° 16' E of observed station.

*Marks.*—Observed station is nail in center of 2-inch stub in center of 2-inch tile pipe with top of stub projecting 12 inches above surface of ground. Subsurface mark is another 2-inch tile pipe buried with top 2 inches below base of surface pipe. Reference station is center point of triangle on standard cement monument projecting 2 inches above surface of ground.

## WATER.

*General locality.*—Western shore of upper Tred Avon River, opposite Watermelon Point, about  $\frac{3}{4}$  mile north of Neck Point, and  $1\frac{1}{4}$  miles north of entrance to Peachblossom Creek. (See Chart No. 34.)

*Immediate locality.*—Observed station is in cultivated field west of a broad marsh about 6 feet above high water, 2 yards west of edge of bank, 35 yards north-northwest of point of bank, 20 yards south of point of bank, and 45 yards east-northeast of inside curve of cut.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 3 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

*References.*—

## WEATHER BUREAU STAFF.

*General locality.*—Eastern side of Tred Avon River in the town of Oxford. (See Charts Nos. 34 and 35.)

*Immediate locality.*—Observed station is in park south of High and Primary Schools, 55 yards east of shore of Tred Avon River, 55 yards west of Morris Street, and in center of circle of trees.

*Marks.*—Observed station is center of galvanized iron staff on square galvanized angle-iron tower.

*References.*—None necessary.

## FIRST.

*General locality.*—Eastern shore of Tred Avon River in town of Oxford about  $\frac{1}{8}$  mile north of railroad wharves. (See Charts Nos. 34 and 35.)

*Immediate locality.*—Observed station is about 8 feet above high water, 2 yards east-southeast of edge of bank, 4 yards east by north of point of bank, 4 yards northeast of edge of bank at small gully, 2 yards south of corner fence post, and 35 yards west of house.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 4 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## SHOW.

*General locality.*—Northern shore of upper Island Creek on a point of land between two coves about  $2\frac{3}{4}$  miles east of Choptank River entrance to creek. (See Charts Nos. 34 and 35.)

*Immediate locality.*—Observed station is about 9 feet above high water, 6 yards northwest of top of bank, and 35 yards east by north of a large cherry tree in clump of large trees.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 3 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## LANDEYE.

*General locality.*—Northeastern shore of Choptank River on point at south side of entrance to Island Creek, about 1 1/2 miles east of Choptank River Light. (See Charts Nos. 34 and 35.)

*Immediate locality.*—Observed station is in cultivated land about 5 feet above high water, 15 yards east-southeast of edge of bank, 50 yards southwest of fringe of trees and bushes, 55 yards south-southwest of point of field and end of fringe of trees and bushes.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 2 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## ST. MICHAELS P. E. CHURCH SPIRE.

*General locality.*—Western side of Miles River in town of St. Michaels at southeast corner of Talbot and Mill Streets. (See Chart No. 34.)

*Immediate locality.*—Observed station is on stone edifice known as St. Michaels Protestant Episcopal Church.

*Marks.*—Observed station is center point of steeple on St. Michaels Protestant Episcopal Church.

*References.*—None necessary.

## MARGO.

*General locality.*—Northeastern shore of Miles River, about 1¼ miles north-northwest of Long Point and 2 miles east of St. Michaels. (See Chart No. 34.)

*Immediate locality.*—Observed station is on a marsh point about 1 foot above high water, 30 yards north of edge of marsh, 35 yards east of extreme point, and 55 yards west of bushes at edge of marsh. Cedar stub marking old triangulation station "Marengo 1899" is at edge of marsh, 29.61 meters S 57° 11' W of observed station.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 6 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument. Reference station "Marengo 1899" is center of five copper nails in top of 5-inch cedar stub 5 feet long with top flush with the surface of the ground.

## DORRANCE.

*General locality.*—Northwestern shore of Miles River about  $1\frac{3}{8}$  miles southwest of Miles River bridge and  $1\frac{5}{8}$  miles northeast of Long Point. (See Chart No. 34.)

*Immediate locality.*—Observed station is about 5 feet above high water, 2 yards northwest of edge of bank, 9 yards west-southwest of a large tree on point of bank, 11 yards west of point of bank, and 12 yards southwest of edge of bank.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 5 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe, buried with top 2 inches below base of monument.

## TANG.

*General locality.*—Northwestern shore of Miles River at south side of entrance to a cove, about  $1\frac{1}{4}$  miles southwest of Miles River bridge. (See Chart No. 34.)

*Immediate locality.*—Observed station is on marsh point about 1 foot above high water, 20 yards northwest of shore, 25 yards north of point of shore, 35 yards west-southwest of another point of shore, and 150 yards southeast of wire fence.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 5 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## BETHEL.

*General locality.*—Southeastern shore of Miles River at north side of entrance to a small creek, about  $\frac{3}{4}$  mile southwest of Miles River bridge. (See Chart No. 34.)

*Immediate locality.*—Observed station is in a clump of pine trees about 3 feet above high water, 9 yards south of shore of rounded point, and 20 yards east of shore.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 4 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## FIG.

*General locality.*—Southeastern shore of Miles River, about 1 mile southwest of Miles River bridge. (See Chart No. 34.)

*Immediate locality.*—Observed station is in cultivated land about 12 feet above high water, 4 yards southeast of edge of tree-covered bank, and 150 yards north-northwest of large barn with two cupolas.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 5 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## MAIDEN.

*General locality.*—Southwestern shore of Miles River about 1/2 mile west of Long Point and 2 1/2 miles southeast of St. Michaels. (See Chart No. 34.)

*Immediate locality.*—Observed station is just outside of a fringe of trees near a small marsh skirting the shore on a point about 3 feet above high water, 3 yards south of shore, 5 yards northeast of foot of bank, 7 yards east of point of bank. Cement monument marking reference station is 4.34 meters S 16° 57' W of observed station. Stone monument marking "Miles River" (1899) is 38.22 meters S 48° 29' E of observed station.

*Marks.*—Observed station is center of 2-inch tile pipe 3 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of surface pipe. New reference station is center point of triangle on standard cement monument projecting 4 inches above surface of ground. Old triangulation station (Miles River, 1899) is center of cross lines on 6-inch square top stone monument.

LAN.

*General locality.*—Northwestern shore of La Trappe Creek, about 3/4 mile north of Choptank River. (See Chart No. 35.)

*Immediate locality.*—Observed station is on tree-fringed high land about 10 feet above high water, 8 yards southeast of shore, 85 yards north of shore, and 105 yards northeast of extreme end of point.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 4 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

BLACK BEACON.

*General locality.*—Northeastern shore of Choptank River off entrance to LaTrappe Creek, about 1 1/2 miles northeast of Horn Point. (See Chart No. 35.)

*Immediate locality.*—Observed station is on a cylindrical foundation known as LaTrappe Creek outer light.

*Marks.*—Observed station is center point of lantern on LaTrappe Creek outer light.

*References.*—None necessary.

## HOWELLS.

*General locality.*—Northern shore of Choptank River on Howells Point about  $1\frac{3}{4}$  miles east of Horn Point, 2 miles north of entrance to Jenkins Creek, and 2 miles northwest of Hambrooks Bar Beacon. (See Chart No. 35.)

*Immediate locality.*—Observed station is on a long grassy gravel point about 3 feet above high water, 50 yards south-southeast of old fish shanty and trees, 25 yards south of highest level part of land, 11 yards west of shore, 3 yards east of shore, and  $\frac{1}{4}$  mile north of extreme end of point. Cement monument marking reference station is 22.82 meters N  $17^{\circ} 53'$  E of observed station.

*Marks.*—Observed station is nail in center of cedar stub in center of 4-inch tile pipe with top of pipe 4 inches below surface of ground. Reference station is center point of triangle on standard cement monument projecting 5 inches above surface of ground.

## RED.

*General locality.*—Northern shore of Choptank River at eastern side of Dickinsons Bay, about  $1\frac{3}{4}$  miles east-northeast of Howells Point and  $\frac{3}{4}$  mile northwest of Kirby Wharf. (See Chart No. 35.)

*Immediate locality.*—Observed station is on cultivated land on first high bluff upstream from Howells Point, about 12 feet above high water, 8 yards northeast of edge of bank, 10 yards north of edge of bank, and 10 yards east of edge of bank. Cement monument marking reference station is 23.65 meters N  $89^{\circ} 58'$  E of observed station and almost on line with east chimney of house.

*Marks.*—Observed station is nail in stub in center of 2-inch tile pipe with top of pipe 6 inches below surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of surface pipe. Reference station is center point of triangle on standard cement monument projecting 5 inches above surface of ground.

## DOUBLE.

*General locality.*—Northern shore of Choptank River nearly opposite Cambridge about 1 mile north-west of entrance to Bolingbroke Creek and  $1\frac{1}{2}$  miles east of Hambrooks Bar Beacon. (See Chart No. 35.)

*Immediate locality.*—Observed station is on point of marsh separated from field by a row of locust trees about 12 yards northeast of shore, 20 yards north of shore, 14 yards east of shore, and 30 yards south of a large wild-cherry tree.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 4 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## BOLING.

*General locality.*—Northern shore of Choptank River on an island in entrance to Bolingbroke Creek about ¾ mile northwest of Chancellors Point and 2 miles east-northeast of Cambridge. (See Chart No. 35.)

*Immediate locality.*—Observed station is in rushes on a sandy marsh about 3 feet above high water, 6 yards northeast of shore, 7 yards north of shore, 8 yards east of shore, and 160 yards northwest by north of entrance to Bolingbroke Creek.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 5 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## REAR.

*General locality.*—Northern shore of Choptank River about  $\frac{1}{4}$  mile northwest of Chancellors Point and  $\frac{1}{2}$  mile southeast of entrance to Bolingbroke Creek. (See Chart No. 35.)

*Immediate locality.*—Observed station is in cultivated field on bluff about 12 feet above high water, 65 yards north of edge of bank, 110 yards northeast of edge of bank and trees, 160 yards east of edge of bank, and 95 yards northwest of bottom of gully.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 6 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## SPINDLE.

*General locality.*—Western shore of upper Choptank River about 3/8 mile north of Jamaica Point Wharf. (See Chart No. 35.)

*NOTE.*—This triangulation landmark was destroyed before this publication was prepared, and therefore it is not described, although its name and location are shown on Chart No. 35.

## BANK.

*General locality.*—Western shore of upper Choptank River about 1 mile north-northwest of Jamaica Point and 1 1/4 miles southwest of entrance to Cabin Creek. (See Chart No. 35.)

*Immediate locality.*—Observed station is in a cultivated field on a tree-fringed bluff about 20 feet above high water, 10 yards northwest of edge of bluff, 10 yards west of edge of bluff, and 12 yards north of edge of bluff.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 4 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

RACCOON.

*General locality.*—Western shore of upper Choptank about  $\frac{3}{8}$  mile south of entrance to a small creek,  $1\frac{1}{2}$  miles north of Jamaica Point, and 1 mile west of entrance to Cabin Creek. (See Chart No. 35.)

*Immediate locality.*—Observed station is between 2 clumps of trees on sandy marsh about 2 feet above high water, 8 yards northwest of shore, 12 yards west of shore, 16 yards north of shore, and 200 yards southwest of woods beyond marsh.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 6 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## FERRY.

*General locality.*—Southern shore of Choptank River near east side of entrance to Hurst Creek about 2 1/2 miles east of Cambridge. (See Chart No. 35.)

*Immediate locality.*—Observed station is on a sand beach about on level with high water, 92 yards east-northeast of Hurst Creek, 1 yard southeast of shore, and 6 to 10 yards northwest to north of several low cedar trees. Cement monument marking reference station is 16.74 meters S 50° 12' E of observed station.

*Marks.*—Observed station is nail in pine stub in center of 2-inch tile pipe with top of pipe 6 inches below surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of surface pipe. Reference station is center point of triangle on standard cement monument.

## E. CAMBRIDGE TALL STACK.

*General locality.*—Southern shore of Choptank River in the town of Cambridge on the east side of Cambridge Creek. (See Chart No. 35.)

*Immediate locality.*—Observed station is tall square brick smokestack at plant of Cambridge Manufacturing Co.

*Marks.*—Observed station is center of stack.

*References.*—None necessary.

## E. CAMBRIDGE SPIRE.

*General locality.*—Southern shore of Choptank River in town of Cambridge on the east side of Cambridge Creek and the south side of Maryland Avenue. (See Chart No. 35.)

*NOTE.*—This triangulation landmark was torn down before this publication was prepared and therefore it is not described, although its name and location are shown on Chart No. 35.

## CAMBRIDGE STAND PIPE.

*General locality.*—Southwestern side of Choptank River in the town of Cambridge. (See Chart No. 35.)

*Immediate locality.*—Observed station is on standpipe on the north side of High Street near Pine Street.

*Marks.*—Observed station is center of cylindrical water standpipe with ornamental railing on top.

*References.*—None necessary.

## CAMBRIDGE.

*General locality.*—Southern shore of Choptank River on a point about  $\frac{3}{4}$  mile southeast of Ham-brooks Bar Beacon and  $\frac{1}{2}$  mile northwest of Cambridge steamer wharf. (See Chart No. 35.)

*Immediate locality.*—Observed station is on a marsh point about 1 foot above high water, 30 yards west of shore, 35 yards south of shore at cut, 40 yards southwest of shore, and 3 yards southwest of barbed-wire fence running northwest and southeast.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 4 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

#### HAMBROOKS BAR BEACON.

*General locality.*—Southern side of Choptank River about ¼ mile offshore from point of land known as Hambrooks Bar, about 2 miles southeast of Howells Point, and 1½ miles northwest of Cambridge. (See Chart No. 35.)

*Immediate locality.*—Observed station is on a cylindrical foundation known as Hambrooks Bar Beacon.

*Marks.*—Observed station is center point of lantern on Hambrooks Bar Beacon.

*References.*—None necessary.

#### COMMAND.

*General locality.*—Southern shore of Choptank River about ½ mile west-southwest of Hambrooks Bar Beacon and about 1½ miles northwest of Cambridge Wharf. (See Chart 35.)

*Immediate locality.*—Observed station is on a marsh point inside of a fence line about 2 feet above high water, 18 yards southeast of shore, 16 yards south of shore, 25 yards southwest of shore, and 150 yards northwest of a boathouse.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 5 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## DICKS WATER TANK.

*General locality.*—Southern shore of Choptank River near Hambrooks Bar about  $\frac{5}{8}$  mile southwest of Hambrooks Bar Beacon, and  $\frac{1}{4}$  mile west of extreme end of Hambrooks Bar. (See Chart No. 35.)

*Immediate locality.*—Observed station is on water tank.

*Marks.*—Observed station is spindle on top of water tank.

*References.*—None necessary.

## HOWARD.

*General locality.*—Southern shore of Choptank River, 2 miles southeast of Horn Point, and about  $\frac{1}{4}$  mile northwest of entrance to Jenkins Creek. (See Chart No. 35.)

*Immediate locality.*—Observed station is on cultivated land on bluff about 12 feet above high water, 25 yards southwest of edge of bluff, 30 yards south of edge of bluff, 35 yards west of edge of bluff, 45 yards west-northwest of corner of fence dividing field from marsh, and 65 yards northeast of the south one of two small poplar trees in field.

*Marks.*—Observed station is center point of triangle on standard cement monument projecting 4 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of monument.

## TOOT.

*General locality.*—Southern shore of Choptank River on Horn Point about  $1\frac{5}{8}$  miles west of Howells Point, and at eastern side of entrance to Lecomptes Bay. (See Chart No. 35.)

*Immediate locality.*—Observed station is in woods about 7 feet above high water, 15 yards south of shore, 13 yards southwest of shore, and 20 yards west of shore, and near but not on highest point of ground. Cement monument marking reference station is 12.38 meters S 33° 34' W of observed station.

*Marks.*—Observed station is nail in center of stub in 2-inch tile pipe projecting 2 inches above surface of ground. Subsurface mark is center of 2-inch tile pipe buried with top 2 inches below base of surface pipe. Reference station is center point of triangle on standard cement monument projecting 4 inches above the surface of the ground.

## BOUNDARIES OF OYSTER BARS.

### EXPLANATION.

The law of the United States authorizing the cooperation of the Department of Commerce and Labor in the survey of natural oyster bars of Maryland provides for the designation and employment by the Department of Commerce and Labor of such officers, experts, and other technically qualified persons "as may be necessary to cooperate with the Maryland State Board of Shell Fish Commissioners in making a survey of and locating the natural oyster beds, bars, and rocks in the waters within the State of Maryland." The oyster laws of Maryland provide that the Maryland Shell Fish Commissioners, with the aid of such persons as may be designated by the Government, shall proceed "to have laid out, surveyed, and designated on the said charts the natural beds and bars, and shall cause to be marked and defined as accurately as practicable the limits and boundaries of the natural beds, bars, and rocks as established by said survey, and they shall take true and accurate notes of said survey in writing, and make an accurate report of said survey, setting forth such a description of landmarks as may be necessary to enable the said board, or their successors, to find and ascertain the boundary lines of the said natural oyster beds, bars, and rocks, as shown by a delineation on the maps and charts." The oyster laws of Maryland also provide in another section that there shall "be made a true and accurate survey of the natural oyster beds, bars, and rocks \* \* \* with reference to fixed and permanent objects on the shore, giving courses and distances, to be fully described and set out in a written report of said survey."

Under the provisions of the laws quoted above the State of Maryland, in cooperation with the Department of Commerce and Labor, must define the boundaries of the natural oyster bars "as accurately as practicable" and also "with reference to fixed and permanent objects on the shore, giving courses and distances." The requirement of "as accurately as practicable" is easily fulfilled by definition of the location of the corners of the oyster bars by latitude and longitude. In fact, this method is probably the most satisfactory and accurate one that could be used for all purposes of legal definition or for relocation of the oyster-bar boundaries by competent engineers. Therefore the additional requirement of "giving courses and distances" is superfluous and is only fulfilled in the published definitions on account of the specific provisions of the law making it compulsory. This part of the description of boundaries has involved an immense amount of extra computations in order to prevent technical discrepancies between the latitude and longitude of a corner of an oyster bar and its distance and bearing from objects on shore of known latitude and longitude without adding anything to the accuracy and very little to the convenience of practical use of the descriptions of the oyster-bar boundaries.

As provided by law the boundaries of the oyster bars are all straight lines, but in the work already completed they have inclosed areas of all shapes from triangles to complicated 14-sided figures, and of all sizes from 4 acres to 7,548 acres. The sides have varied in length from 93 to 7,529 yards, and in some cases the corners of the boundaries have been practically at the triangulation stations from which they are located, while in other instances they were over 13,600 yards from the landmarks most available for the purpose of fixing their position.

The varied characteristics of the legal boundaries of the oyster bars indicated by the above statement, together with the complicated requirements of the law under which the survey has been made, and the magnitude of the work with the consequent need of fixed and uniform methods, have made the problem of describing the boundaries one of considerable difficulty and great importance.

The boundaries of the oyster bars of Maryland, as established by the Shell Fish Commission and delineated on the Coast and Geodetic Survey charts and projections and on the leasing charts of the Commission, are technically defined and described by a method somewhat different from that used in other oyster surveys. But it is believed that the forms finally adopted will fulfill all needs of the survey for both the present and the future.

#### METHOD OF DESCRIBING BOUNDARIES.

The descriptions have been arranged in tabular form, thus avoiding many hundred repetitions of the same words by making one explanation of the tables sufficient for all oyster bars in each county.

*Title.*—At the top of each tabular form is given the legal name of the oyster bar to be described, and the one by which it is known and designated in the published oyster records and on the oyster charts. The adopted name of the oyster bar is the one used locally, as nearly as could be ascertained by the hydrographic engineer of the Commission; and when there was no local name in common use a name was selected from one of the prominent features of the vicinity that would naturally suggest the section of the waters where the oyster bar was located.

Underneath the name, in parentheses, is given the general locality of the oyster bar and the serial number of the "Maryland Oyster Chart" on which its legal boundaries are shown.<sup>1</sup>

*First column.*—This column, under the heading of "Corner of bar," gives the number corresponding to the corner of the boundary as shown on the charts and to the number on the buoy marking the actual corner of the bar. The numbers of the corners have been assigned by naming the southernmost point No. 1, thence proceeding in a clockwise direction around the bar. Where a corner of one oyster bar is identical with the corner of the boundaries of one or more other oyster bars, only the number of the corner of the oyster bar being described in the table is given in this column.

*Second and third columns.*—These two columns, under the headings of "Latitude" and "Longitude," give the geographic positions of the corners. These positions have been adopted by the Commission as the primary technical definition of the location of

<sup>1</sup> These charts can be obtained by application to the Superintendent of the Coast and Geodetic Survey, at Washington, D. C.

the corners, and should be considered as final in case of a dispute arising from discrepancies caused by other means of location. The latitudes and longitudes given in these columns are based on the United States standard datum of the Coast and Geodetic Survey, and the points thus defined can be relocated from distant triangulation stations of the survey, even though all the landmarks and buoys originally used for their location have been destroyed by natural or other causes.

*Fourth and fifth columns.*—These two columns, under the general heading of "True bearing"<sup>1</sup> and the specific headings "Forward" and "Back," give bearings measured from a true north-and-south line. The three "Forward" bearings are from the corner of the boundary designated in the first column to the triangulation stations named on the corresponding lines in the last column, and the three "Back" bearings are from these same stations in the last column to the corresponding corner of boundary in the first column. The difference in minutes of arc between the forward and back bearings shown in some cases is actual and not accidental, and is due to the fact that the computations took into account the spheroidal shape of the earth.

*Sixth column.*—This column, under the heading of "Distance," gives the three computed distances in yards from the corner of the bar noted in the first column to the three triangulation stations named on the corresponding lines in the last column, and vice versa.

*Seventh column.*—This column, under the heading of "U. S. C. & G. S. triangulation station,"<sup>2</sup> gives the names of the landmarks from which were computed the corresponding "Latitude," "Longitude," "True bearing" and "Distance" of the "Corner of bar" designated in the first column. A full description of the location and markings of these triangulation stations is given in another part of this publication under the heading of "Descriptions of triangulation stations."

#### SURVEYING METHODS FOR RELOCATION OF BOUNDARIES.

There are a number of methods that can be used in the relocation of the actual boundaries of the natural oyster bars as technically described in this publication and delineated on the published charts of the Coast and Geodetic Survey and the leasing charts of the Shell Fish Commission.

The following brief descriptions of five of these more or less different methods assume a certain amount of experience and knowledge on the part of the engineer in the particular kind of surveying under consideration, and are only intended as reminders of ways and means that can be used.

There are two problems that are likely to present themselves to those interested in the boundaries of natural oyster bars: one, to determine whether the buoys marking the corners have been dragged or otherwise moved from their correct positions, and the other, to relocate or reestablish a buoy at the point from which it was removed. The different ways of solving these two problems partly depend upon the instruments possessed by the engineer and his assistants and partly on his training and experience.

<sup>1</sup> The mean magnetic variation for Talbot County was 6° 10' west of north in 1911 and increasing at the rate of 5' yearly.

<sup>2</sup> Geographic positions of these triangulation stations can be obtained by application to the Superintendent of the Coast and Geodetic Survey, Washington, D. C.

(1) *Triangulation*.—This method is the one that will give the greatest accuracy, but on account of its requiring special data and instruments, and being an operation rarely used by engineers not engaged in geodetic surveying, it is recommended only for cases in dispute that can not be settled satisfactorily by some other method. An explanation of this class of work would be too long for a report of this sort, and those not familiar with this method are referred to the publications on the subject by the Coast and Geodetic Survey.

(2) *Hydrographic*.—This method is the most simple and satisfactory one that can be adopted if the surveyor can obtain the use of the necessary instruments and assistants. It is the one best suited for the work of the engineers of the Commission in relocating corners of boundaries, as it gives results of the accuracy ordinarily required and is rapid in execution. Besides, it has the advantage of being available whenever three triangulation stations of suitable relative positions are visible from the offshore points needing relocation.

Most navigators and others familiar with the use of a sextant are well acquainted with the graphic three-point method of fixing a position on water, and only a brief description of the operation will be stated.

In the case where there is only one engineer having a single sextant, the three-point method can be used if the two angles determining the position of a buoy are first derived from the "Forward" bearings given in the tabular forms describing the boundaries of the oyster bars. For example, take "Poplar Island" oyster bar, which is the first one described in this publication, and assume that "Corner No. 3," is to be examined as to its position. The angle between the two landmarks "Valliant" and "Haddaway," as determined from right to left from the forward bearings from this corner, is  $58^{\circ} 17'$ , and the angle between "Haddaway" and "Bloody Point Bar Light" is  $120^{\circ} 05'$ . Having these two angles, the engineer proceeds to the buoy of doubtful location and measures the actual sextant angles between the landmarks for which the calculations were made. If the measured and calculated angles do not agree, the buoy is not in its correct position and the boundary corner must be relocated. This is accomplished by moving the boat about until a point is reached where the angles do agree, and this point being the desired location, the buoy can be placed in its correct position.

If the engineer can obtain the use of both a sextant and a three-arm protractor (position finder), the availability of the hydrographic method is increased, as the use of the protractor is essential in case of the washing away or destruction of one or more of the landmarks originally used in describing the boundaries. Under these circumstances any three landmarks of suitable relative position that are visible from the point to be located can be utilized. For example, the engineer can proceed to the buoy of doubtful position and measure the two adjacent sextant angles between the three landmarks selected. These two angles are set off on the three-arm protractor and the actual position of the buoy plotted on the chart by shifting the protractor about until the edge of each of the three arms passes through the center of the symbols on the chart marking the position of the three landmarks selected. The center of the hub of the protractor will indicate on the chart the actual position of the buoy, and if the point thus obtained does not coincide with the true position of the corner of the boundary as given on the chart, the surveyor can proceed to locate the buoy correctly by reversing the operation.

This is done by placing the center point of the hub of the protractor over the corner of the boundary in question and measuring on the chart the two adjacent protractor angles between the three selected landmarks. One of the angles thus obtained is set on the sextant and the boat moved about until the two landmarks are shown by the sextant to subtend the same angle obtained from the protractor. The second angle is then placed on the sextant and the same operation gone through, and so on, first using one angle on the sextant, then the other, until a point is reached where both observed sextant angles are practically identical with the protractor angles. The point thus located is the desired one and the buoy can be placed to mark the true position of the corner of the boundary in question.

If the engineer possesses two sextants and a protractor, this problem is far easier of solution, as the two angles can be set off on separate sextants and the observer can quickly find the desired point where they agree with the protractor angles by using one sextant after the other without the need of resetting either.

If there are two observers, two sextants, and a protractor, it can be seen that the best conditions for both rapid and accurate hydrographic location of a point is attained. In fact, this is the method by which the buoys at the corners of the boundaries were originally placed by the hydrographic engineer to the Commission.

(3) *Magnetic bearings from offshore.*—This method of fixing a position on water is a simple and well-known one in navigation. It is available to anyone having a boat compass and will be of special use to the State Fishery Force in investigating cases where buoys are supposed to have been moved for illegal purposes.

In the case where a buoy is supposed to have been moved from its true position the observer can take compass bearings to the three landmarks given in the last column of the tables opposite the boundary corner in question. These bearings are then corrected for the local declination,<sup>1</sup> and if the results agree with the published bearings the buoy is correctly located.

In the case where the buoy is not in its correct position, or has disappeared altogether, the desired point can be determined by maneuvering the vessel until the corrected bearings agree with the ones in the tabular descriptions, when the buoy can be anchored in its proper location.

In the case where the landmarks for which the bearings are published have been destroyed or washed away, any landmarks whose positions are indicated on the charts can be used. This can be done by getting their bearings directly from the chart by parallel rulers or a protractor and then applying these new bearings in the same manner as the ones published in the tables.

(4) *Magnetic bearings from shore.*—This method will be of special value to engineers having an ordinary surveyor's compass. The compass can be set over the point marking a "triangulation station" on shore, the name of which is given in the last column opposite the "corner" in question. The instrument is then set at the corresponding "back" bearing (corrected for local magnetic declination) given in the fifth column of the tables opposite the "corner" in question. The direction thus determined will give one range on which the desired point must be located. The compass can then be moved to a

<sup>1</sup> The mean magnetic variation for Talbot County is 6° 20' west of north in 1911 and increasing at the rate of 5' yearly.

second triangulation station and another range located in a similar manner. The intersection of these two range lines will give the desired point; but in general it should be checked by an additional range line determined from a third station.

(5) *Horizontal angles measured at landmarks.*—This process is a modification of the triangulation method, and will be useful to engineers who have a transit and desire considerable accuracy.

The instrument is placed over a "triangulation station," the name of which appears in the last column of the tabular description opposite the "corner" in question. The telescope is then pointed to the landmark indicated in the "Descriptions of landmarks" as having a direction of  $0^{\circ} 00' 00''$  from the triangulation station being occupied by the transit. The tabular description of the boundaries is next examined and the "back" bearing of the questionable boundary "corner" from the landmark being occupied is taken out. The angle calculated from this "back" bearing and the bearing given in parentheses alongside the zero landmark in the "Descriptions of landmarks" is then set off on the transit and a range line established on which the desired point must be located. A similar process is then carried on at a second station, and so on until the position of the buoy is satisfactorily fixed.

## APPENDIXES.

---

### APPENDIX A.—LAWS RELATING TO THE COOPERATION OF THE COAST AND GEODETIC SURVEY AND BUREAU OF FISHERIES WITH THE MARYLAND SHELL FISH COMMISSION.

The work of the Coast and Geodetic Survey and of the Bureau of Fisheries, in cooperation with the Maryland Shell Fish Commission, in surveying the oyster bars, establishing permanent landmarks at triangulation stations, and preparing for publication the necessary charts and technical and legal descriptions of boundaries and landmarks shown on these charts, has been executed in compliance with a request from the governor of the State of Maryland to the Secretary of Commerce and Labor, and by the authority of the following laws of the United States and Maryland:

[Act of Congress approved May 26, 1906.]

AN ACT To authorize the Secretary of Commerce and Labor to cooperate, through the Bureau of the Coast and Geodetic Survey and the Bureau of Fisheries, with the shellfish commissioners of the State of Maryland in making surveys of the natural oyster beds, bars, and rocks in the waters within the State of Maryland.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the Secretary of Commerce and Labor be, and he is hereby, authorized and directed, upon the request of the governor of the State of Maryland, to designate such officers, experts, and employees of the Bureau of the Coast and Geodetic Survey and of the Bureau of Fisheries as may be necessary to cooperate with the Maryland State board of shellfish commissioners in making a survey of and locating the natural oyster beds, bars, and rocks in the waters within the State of Maryland; and the Secretary of Commerce and Labor is hereby authorized and directed to furnish to the officers, experts, and employees of said Bureaus so detailed as aforesaid such instruments, appliances, and steam launches as may be necessary to make the survey aforesaid; and the Secretary of Commerce and Labor is hereby authorized to have made in the Bureau of the Coast and Geodetic Survey all the plats necessary to show the results of the aforesaid survey and the locations of the said natural oyster beds, bars, and rocks in the waters within the State of Maryland, and to furnish to the board of shellfish commissioners of the State of Maryland such copies as may be necessary, and for this purpose to employ, in the District of Columbia and elsewhere, such technically qualified persons as may be necessary to carry out the purpose of this act.

SEC. 2. That the Secretary of Commerce and Labor is hereby further authorized to have erected or constructed by the officers so detailed as aforesaid, while making such survey, such structures as may be necessary to mark the points of triangulation, so that the same may be used for such future work of the Coast and Geodetic Survey as the said Bureau may be hereafter required to perform in prosecuting the Government coast survey of the navigable waters of the United States located within the State of Maryland.

\* \* \* \* \*

SEC. 4. That this act shall take effect from the date of its passage.

---

[Act of Congress approved June 30, 1906.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and seven, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and seven, namely: \* \* \*

*Survey of Oyster Bars, Talbot County, Md.*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including the expenditures authorized under Public Act Numbered One hundred and eighty-one, approved May twenty-six, nineteen hundred and six, and contingent expenses incident thereto, five thousand dollars, together with the unexpended balance under this appropriation for nineteen hundred and six and prior years which is hereby reappropriated and made available on this account for the fiscal year nineteen hundred and seven \* \* \*.

---

[Act of Congress approved March 4, 1907.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and eight, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and eight, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, to be immediately available and to continue available until expended, twenty-five thousand dollars \* \* \*.

---

[Act of Congress approved May 27, 1908.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and nine, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and nine, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, which expenses, including cost of plats and charts, shall not exceed fifteen thousand dollars in any one year, to be immediately available, twenty thousand dollars.

---

[Act of Congress approved March 4, 1909.]

AN ACT Making appropriation for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and ten, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and ten, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, which expenses, including cost of plats and charts, shall not exceed fifteen thousand dollars in any one year, to be immediately available, twenty thousand dollars.

---

[Act of Congress approved June 25, 1910.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and eleven, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and eleven, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys, \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, to be immediately available fifteen thousand dollars.

[Act of Congress approved March 4, 1911.]

AN ACT Making appropriation for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and twelve, and for other purposes.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the following sums be, and the same are hereby, appropriated, for the objects herein-after expressed, for the fiscal year ending June thirtieth, nineteen hundred and twelve, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, to be immediately available, thirteen thousand dollars.

[Act of the Legislature of Maryland approved April 2, 1906.]

AN ACT To establish and promote the industry of oyster culture in Maryland, to define and mark natural oyster beds, bars and rocks lying under the waters of this State, to prescribe penalties for the infringement of the provisions of this Act, and \* \* \*

SECTION 1. Be it enacted by the General Assembly of Maryland, That the following sections be, and they are hereby, added to article 72 of the Code of Public General Laws, title "Oysters." \* \* \*

SEC. 86. The Board of Shell Fish Commissioners shall, as soon as practicable after the passage of this Act, cause to be made a true and accurate survey of the natural oyster beds, bars and rocks of this State, said survey to be made with reference to fixed and permanent objects on the shore, giving courses and distances, to be fully described and set out in a written report of said survey, as hereinafter required. A true and accurate delineation of the same shall be made on copies of published maps and charts of the United States coast and geodetic survey, which said copies shall be filed in the office of the said commissioners in the city of Annapolis, and the said commissioners shall further cause to be delineated upon copies of the published maps and charts of the United States coast and geodetic survey, of the largest scale, one copy for each of the counties of this State in the waters of which there are natural oyster beds, bars and rocks, all natural beds, bars and rocks lying within the waters of such county, which maps shall be filed in the offices of the clerks of the Circuit Court for the respective counties wherein the grounds so designated may lie. \* \* \*

SEC. 87. The Governor of this State is hereby requested to ask the assistance of the United States coast and geodetic survey, and of the United States Fish Commissioner, to aid in the carrying out of the provisions of the preceding section.

\* \* \* \* \*

SEC. 89. As soon as practicable after the first day of April, 1906, the said commissioners shall organize, and shall at once proceed, with the assistance of such person or persons as may be detailed by the United States coast and geodetic survey and the United States Fish Commissioner, to aid them in their work, and of such persons as may be appointed under the preceding section, to have laid out, surveyed and designated on the said charts, the natural beds and bars, and shall cause to be marked and defined as accurately as practicable the limits and boundaries of the natural beds, bars, and rocks as established by said survey, and they shall take true and accurate notes of said survey in writing, and make an accurate report of said survey, setting forth such a description of landmarks as may be necessary to enable the said board, or their successors, to find and ascertain the boundary lines of the said natural oyster beds, bars and rocks, as shown by a delineation on the maps and charts provided in this Act; said report shall be completed and filed in the office of the board in the city of Annapolis within ninety days after the completion of the survey of any county. Said commissioners shall cause the same to be published in pamphlet form, and transmit copies of the same to the Clerks of the Circuit court for the respective counties, where the charts have been filed or directed to be filed as hereinafter provided; the said report to be filed by the clerks of the several counties in a book kept for that purpose. And the said survey and report, when filed, subject to the right of appeal hereafter provided for in this Act, shall be taken in all of the courts of this State as conclusive evidence of the boundaries and limits of all natural oyster beds, bars and rocks, lying within the waters of the county wherein such survey and report are filed, and shall be construed to mean in all of the said courts that there are no natural oyster beds, bars or rocks lying within the waters of the counties wherein such report and survey are filed other than those embraced in the survey authorized by this Act, and that all areas of the Chesapeake Bay and its tributaries within the State of Maryland, not shown in the survey to be natural

oyster beds, bars or rocks shall be construed in all the courts of the State to be barren bottoms and open for disposal by the State for the purpose of private planting or propagation of oysters thereon under the provisions of this Act, provided, that the said survey and report shall not be construed as to affect in any manner the holdings by citizens of this State in any lot which may have been appropriated or taken up under the laws of this State prior to the approval of this Act.

The law of the State of Maryland, passed March 9, 1842, authorizing officers of the United States Coast and Geodetic Survey to enter upon the lands within the State limits for the purposes of the survey, is as follows:

AN ACT Concerning the Survey of the Coast of Maryland.

SECTION 1. *Be it enacted by the General Assembly of Maryland*, That it shall and may be lawful for any person or persons employed under and by virtue of an act of the Congress of the United States, \* \* \* at any time hereafter to enter upon lands within this State for the purpose of exploring, surveying, triangulating, or leveling, or doing any other matter or thing which may be necessary to effect the objects of said act, and to erect any works, stations, buildings, or appendages requisite for that purpose, doing no unnecessary injury to private or other property.

SEC. 2.<sup>1</sup> *And be it enacted*, That in case the person or persons employed under the act of Congress aforesaid, can not agree with the owners or possessors of the land so entered upon and used as to the amount of damage done thereto by reason of the removal of fences, cutting of trees or injury to the crop or crops growing on the same, it shall and may be lawful for the said parties or either of them to apply to the chief justice for the time being or one of the associate judges of the judicial district in which such land may be situated, who shall thereupon appoint three disinterested and judicious freeholders, residents of the same judicial district, to proceed with as much despatch as possible to the examination of the matter in question, and the faithful assessment of the damages sustained by the owners or possessors aforesaid, and the said freeholders or a majority of them, having first taken and subscribed an oath or affirmation before the chief or associate justice aforesaid or other person duly authorized to administer the same, that they will well and truly examine and assess as aforesaid, and having given five days' notice to both parties of the time of their meeting, shall proceed to the spot, and then and there upon their own view and if required, upon the evidence of witnesses (to be by them sworn or affirmed and examined), shall assess the said damages, and shall afterward make report thereof and of their proceedings in writing under their hands and seals and file the same within five days thereafter in the office of the clerk of the county in which the land aforesaid is situated, subject to an appeal by either party to the county court of the said county within ten days after filing as aforesaid, and the said report so made as aforesaid if no appeal as aforesaid be taken, shall be held to be final and conclusive as between the said parties, and the amount so assessed and reported shall be paid to the said owners or possessors of the land so damaged within twenty days after the filing of said report, and the said chief or associate justice as aforesaid, shall have authority to tax and allow upon the filing of said report, such costs, fees and expenses to the said freeholders for the performance of their duty as he shall think equitable and just, which allowance shall be paid by the person or persons employed under the act of congress aforesaid, within the time last above limited, but if an appeal as aforesaid be taken, the case shall be set down for hearing at the first term of county court aforesaid, ensuing upon and after appeal, and it shall be lawful for either party immediately after the entry of such appeal, to take out summons for such witnesses as may be necessary to be examined upon the hearing aforesaid, and the said court shall have power in its discretion to award costs against which ever the final judgment shall be entered, and such appeal at the option of either party may and shall be heard before and the damage assessed by a jury of twelve men to be taken from the regular panel and elected as in other cases.

SEC. 3. *And be it enacted*, That if any person or persons shall wilfully injure or deface or remove any signal, monument or building or any appendage thereto, erected, used or constructed under and by virtue of the act of congress aforesaid, such person or persons so offending shall severally forfeit and pay the sum of fifty dollars with costs of suit to be sued for and recovered by any person who shall first

<sup>1</sup> Under the rulings of the Comptroller of the Treasury no damages can be collected except through the United States Court of Claims unless an agreement has been made in advance.

prosecute, the same before any justice of the peace of the county where the person so offending may reside, and shall also be liable to pay the amount of damages thereby sustained, to be recovered with costs of suit in an action on the case, in the name and for the use of the United States of America, in any court of competent jurisdiction.

APPENDIX B.—THE HAMAN OYSTER CULTURE LAW.

[Extract from Second Report of Shell Fish Commission.]

OBJECT.

"The legislature in placing chapter 711 of the acts of 1906, better known as the Haman oyster culture law, upon the statute books of Maryland, had a twofold object in view:

"1. To encourage an industry in oyster culture upon the barren bottoms beneath the tidewaters of the State.

"2. To prevent the leasing of natural oyster bars for the purpose of oyster culture."

SURVEY.

"To make the leasing of barren bottoms possible and the leasing of natural bars impossible, provision was made for a survey of the natural bars for the purpose of accurately locating and marking the same. It was definitely provided that no barren bottoms should be leased in any part of the State until the natural bars of that region had been surveyed, charted, and marked with buoys."

DEFINITION OF A NATURAL OYSTER BAR.

NATURAL BAR NOT DEFINED.

"The Shell Fish Commission is instructed by section 90 of the Haman oyster culture law to exercise its judgment liberally in favor of the natural bars when surveying, charting, and buoing them, but other than this the commission is uninstructed in this important matter. The responsibility of defining a natural bar is placed upon the commission.

DIVERSITY OF OPINION.

"No definition of a natural oyster bar could be formulated by any man or body of men which would meet with the approval of all parties concerned. Oystermen, as a rule, hold that all bottoms where oysters grow or have grown naturally, even though now practically barren of oysters, should be considered natural bars. Other citizens of the State, who are not directly interested in the oyster business but interested in the oyster industry from the standpoint of revenue, hold, as a rule, that no bottoms should be excluded from leasing for oyster culture which by methods known to oyster culturists may be made to yield a greater number of oysters than they now produce.

"It should be evident to everyone that neither of these definitions could be adopted by the commission as a working basis for determining which of the grounds surveyed are natural oyster bars."

THE GOLDSBOROUGH DEFINITION.

The definition of a natural oyster bar which very nearly approaches a reasonable and satisfactory compromise between the views of the subject held by oystermen on one hand and by oyster culturists on the other is that contained in an opinion rendered by Judge Charles F. Goldsborough in the circuit court for Dorchester County in the July term, 1881, in the case of William T. Windsor and George R. Todd *v.* Job T. Moore.

This definition has been adopted by the Shell Fish Commission as the basis for the determination of the status of the various oyster bottoms surveyed, and is as follows:

What, then, is a natural bar or bed of oysters? It would be a palpable absurdity for the State to attempt to promote the propagation and growth of oysters and to encourage its citizens, by a grant of land, to engage in their culture, if the lands authorized to be taken up were only those upon which oysters do not and can not be made to grow. That there may be lands covered by water in the State

where no oysters can be found, but where, if planted, they could be cultivated successfully, may be possible; but if so, I imagine that their extent must be too limited for them to be of much practical general advantage for the purposes of such a law as the one under discussion; but there are thousands of acres of hard and shifting sands where oysters not only are not found, but where it would be folly to plant them, and these latter it can not be supposed that the State intended to offer to give away, for the simple reason that the State could not help knowing that nobody would have them.

Upon the other hand there are large and numerous tracts where oysters of natural growth may be found in moderate numbers, but not in quantities sufficient to make it profitable to catch them, and yet where oysters may be successfully planted and propagated. In my opinion these can not be called natural bars or beds of oysters within the meaning of the act of assembly, and it is just such lands as these that the State meant to allow to be taken up under the provisions of the above-mentioned section of the act.

But there is still another class of lands where oysters grow naturally and in large quantities and to which the public are now and have been for many years in the habit of resorting with a view to earning a livelihood by catching this natural growth, and here, I think, is the true test of the whole question. Land can not be said to be a natural oyster bar or bed merely because oysters are scattered here and there upon it and because if planted they will readily live and thrive there; but whenever the natural growth is so thick and abundant that the public resort to it for a livelihood, it is a natural oyster bar or bed and comes within the above-quoted restriction in the law, and can not be located or appropriated by any individual.

#### APPLICATION OF DEFINITION.

Before this definition may be of use in determining accurately and scientifically the status of an oyster ground, its central idea, "livelihood," must be expanded into accurately determinable factors, and these factors must be combined into a practical scheme of investigating the condition of the ground under consideration.

Stated briefly, a livelihood is represented by a sum of money obtained from the sale, at a fixed price, of a certain quantity of oysters gathered in a given time from an allotted area of ground.

Knowing the value of each of these factors, it becomes possible to calculate the number of oysters an oyster ground must produce per square yard in order that oystermen may secure a livelihood by working upon it.

NOTE.—The factors into which the commission resolved the livelihood problem, the value assigned to each factor, and the scheme devised for practical use in examining and applying the definition to oyster bottoms are given in outline in their second report under the heading of the preceding extract, and in detail in their first report on pages 32 to 69.

#### APPENDIX C.—SUMMARY OF THE PARTICULAR SURVEYING OPERATIONS WHICH CONSTITUTE AN "OYSTER SURVEY" AS NOW BEING CARRIED ON IN MARYLAND.

*Explanation.*—A brief account of the particular surveying operations which constitute an "oyster survey" as now being carried on in Maryland, will assist in the interpretation of records contained in the technical part of this report, and will be of interest to many who may not understand the necessity for the great amount of work being done or its complicated character.

To those familiar with methods used in surveying and charting the characteristic features of large bodies of water there is an evident necessity for the various operations performed, especially when it is known that the boundaries of the public oyster bars and of the private lots leased for purposes of oyster culture must be surveyed and charted with the greatest practical accuracy. To others it will be sufficient to state that the actual experience gained from oyster surveys in other States has proven that in order to avoid endless dissatisfaction and litigation it is necessary to accurately locate and permanently establish oyster boundaries as is now being done in Maryland.

*Triangulation survey.*—Such refinement of survey work as that demanded by the conditions of an oyster survey when carried on at considerable distances offshore can only be obtained by the use of a system of triangulation as a framework or foundation. Therefore, a triangulation survey, including the permanent marking of the positions of landmarks with monuments, and a record of the descriptions of their locations for future recovery is a necessary operation of a complete oyster survey.

*Topographic survey.*—The technical records which establish the relation between the offshore oyster boundaries and triangulation landmarks are sufficient for the requirements of engineers in making resurveys, but do not supply the needs of others who are interested in the same boundaries by reason of their occupation as oystermen concerned as to the public oyster bars, or oyster culturists concerned as to the leasable bottoms. For these it is necessary to have the charts of the survey show the relation of the shore line and other topographic features to the boundaries of the public oyster bars and private oyster farms. Therefore a topographic survey is a necessary operation of a complete oyster survey.

*Hydrographic survey.*—In the settlement of the important question of what is or what is not a natural oyster bar, and in the consideration of bottoms to be selected for purposes of oyster culture, information as to the depth of water and the character of the bottom is required. Therefore a hydrographic survey is a necessary operation of a complete oyster survey.

*Necessary foundation for an oyster survey.*—Consequently, the necessary components of a satisfactory foundation for a complete oyster survey are the three classes of survey operations technically named triangulation, topography, and hydrography, or, stated in another way, the foundation of a practical oyster survey includes the surveying operations usually followed by the Coast and Geodetic Survey leading up to the preparation and publication of nautical charts.

*Special surveys and investigations pertaining to oysters.*—Having obtained this cartographic survey for a foundation, partly by new work and partly from records of previous work of the Government, the combined operations<sup>1</sup> making up an "oyster survey" are completed by superimposing on this foundation special surveys and investigations pertaining particularly to oysters or other shell fish.

The special surveys pertaining to oysters furnish information as to the location and outline of oyster-shell bottoms, and are carried on by the sounding-boat party in addition to the usual hydrographic work.<sup>2</sup> This operation consists of the observation and record of the character of vibration of a wire and chain apparatus which is dragged over the bottom, the vibrations or lack of vibrations indicating the presence and quantity of shells or absence of shells.

The special oyster investigations<sup>3</sup> consist of the actual determination of the kind and quantity of oysters on the bottom, and such economic and biological studies of the supply of oyster food, density of water, character of the bottom, and other important matters as affect the growth of oysters. In this work the oyster investigation stations are located and buoyed by the hydrographic party while engaged in the survey of the oyster-shell limits. They are selected with the view of obtaining characteristic data which can be used for the interpretation of the recorded vibrations of the chain apparatus at all other points covered by the survey.

*Preparation of results.*—The actual surveying operations and oyster investigations having been completed for any one county, there still remains technical work of nearly equal magnitude to that described.<sup>4</sup> This work consists of the preparation of charts and technical descriptions of boundaries and landmarks for publication by the Government, the preparation of that part of the annual report of the commission covering the special oyster surveys and investigations, the making of the leasing charts and finished projections, and finally the filing of the oyster charts and records with the courts and the commission, thus opening a county for oyster culture.

*Summary.*—From the foregoing account it can be seen that a complete oyster survey properly conducted so as to answer all practical requirements of the present and permanency of results for the future is a very complicated affair, involving many lines of surveying and other scientific work, and requiring the professional services of experts in the various operations of cartographic surveying and shell-fish investigations.

<sup>1</sup> See Appendix D of this publication for "Statistics of results of combined operations of the Government and State."

<sup>2</sup> See pp. 104 to 123 of "First Annual Report of Maryland Shell Fish Commission."

<sup>3</sup> See pp. 30 to 67 and 129 to 199 of "First Annual Report of Maryland Shell Fish Commission."

<sup>4</sup> No mention is made here of the large amount of administrative work of the commission, which is greatly complicated and increased by the effect of the oyster-survey operations on many thousands of people whose interests are more or less involved; or of the large amount of survey work involved in the survey and record of the boundaries of oyster lots leased from the State by private individuals for the purposes of oyster culture.

## Survey of Oyster Bars, Talbot County, Md.

APPENDIX D.—STATISTICS OF RESULTS OF THE COMBINED OYSTER SURVEY OPERATIONS OF THE GOVERNMENT AND STATE.<sup>1</sup>

Operations	Anne Arundel County	Somerset County	Wicomico County	Worcester County	Calvert County	Charles County
Beginning of field work.....	June 29, 1906	May 2, 1907	Aug. 27, 1907	Nov. 8, 1907	May 2, 1908	Aug. 18, 1908
Filing of certified charts and reports.....	June 20, 1907	July 1, 1908	Dec. 1, 1908	Apr. 12, 1909	Dec. 14, 1909	Jan. 27, 1911
Natural oyster bars surveyed and delineated <sup>2</sup> .....	91	37	15	28	41	15
Acres of natural oyster bars.....	33,577	27,566	2,038	1,655	12,303	2,285
Crab bottoms surveyed and delineated.....		54				
Acres of crab bottoms.....		32,108				
Clam beds surveyed and delineated.....		3				
Acres of clam beds.....		506				
Boundary buoys located and planted.....	362	154	53	104	149	51
Triangulation landmarks established.....	123	86	30	48	78	42
Miles of shore line covered by triangulation.....	110	125	46	95	95	32
Square miles of water covered by triangulation.....	220	375	44	110	157	20
Miles of examination of shell bottom with chain apparatus.....	425	340	59	63	250	38
Oyster investigation stations occupied.....	440	679	162	147	667	113
Tide stations established.....	4	3	1	1	2	1
Number of soundings over shell bottoms.....	37,049	17,904	3,387	3,649	11,292	1,631
Square miles covered by soundings and chain apparatus.....	58	55	3	3	30	4
Projections prepared and plotted.....	9	13	2	5	8	3
Leasing charts prepared.....	13	12	2	3	5	2
Oyster charts published.....	4	6	2	3	5	1
Reports published.....	2	2	2	2	2	2
Progress maps published.....	2	2	2	2	2	2

Operations	St. Marys County	Baltimore County	Kent County	Queen Annes County	Talbot County	Total <sup>3</sup>
Beginning of field work.....	May 2, 1908	Apr. 14, 1909	Apr. 14, 1909	Apr. 14, 1909	July 6, 1909	
Filing of certified charts and reports.....	July 6, 1911	Aug. 10, 1911	Oct. 5, 1911	Nov. 29, 1911	July 20, 1912	
Natural oyster bars surveyed and delineated <sup>2</sup> .....	124	3	64	98	132	648
Acres of natural oyster bars.....	25,755	3,010	12,809	24,721	36,564	182,283
Crab bottoms surveyed and delineated.....						54
Acres of crab bottoms.....						32,108
Clam beds surveyed and delineated.....						3
Acres of clam beds.....						506
Boundary buoys located and planted.....	375	12	211	340	529	2,340
Triangulation landmarks established.....	238	15	147	199	336	1,022
Miles of shore line covered by triangulation.....	160	12	110	240	230	1,070
Square miles of water covered by triangulation.....	180	50	130	500	240	1,710
Miles of examination of shell bottom with chain apparatus.....	400	33	164	288	511	2,571
Oyster investigation stations occupied.....	1,472	64	1,151	1,949	1,975	8,819
Tide stations established.....	7	1	3	3	5	26
Number of soundings over shell bottoms.....	19,344	1,080	8,123	13,880	20,213	137,552
Square miles covered by soundings and chain apparatus.....	57	6	21	47	77	361
Projections prepared and plotted.....	15	4	10	12	14	69
Leasing charts prepared.....	10	1	4	11	12	53
Oyster charts published.....	8	1	3	4	7	35
Reports published.....	2	2	2	2	2	15
Progress maps published.....	2	1	1	1	1	13

<sup>1</sup> These statistics do not include the large amount of triangulation, topography, and hydrography resulting from previous work of the Coast and Geodetic Survey, which was utilized in the preparation of the published oyster charts and records. Work in Kent, Queen Annes, Talbot, and Dorchester Counties has been finished, but final statistics of results will not be published until these counties are opened for oyster culture.

<sup>2</sup> Less quantities covered by statistics of more than one county.

<sup>3</sup> Total area of natural oyster bars of Connecticut, 5,770 acres.

## LETTER OF SUBMITTAL.

DEPARTMENT OF COMMERCE AND LABOR,  
COAST AND GEODETIC SURVEY,  
*Washington, November 12, 1908.*

SIR: I have the honor to transmit herewith a report of the officer detailed from the Coast and Geodetic Survey to cooperate with the Bureau of Fisheries and the Maryland Shell Fish Commission in surveying the oyster bars of the State of Maryland, and certain technical results which are necessary for the interpretation and use of the plats of the survey made by the Government.

This work has been done under the provisions of the act of Congress entitled "An act to authorize the Secretary of Commerce and Labor to cooperate, through the Bureau of the Coast and Geodetic Survey and the Bureau of Fisheries, with the shell fish commissioners of the State of Maryland in making surveys of the natural oyster beds, bars, and rocks in the waters within the State of Maryland," approved May 26, 1906, and of the acts of Congress making appropriations for sundry civil expenses of the Government for the fiscal years ending June 30, 1907, 1908, and 1909.

Respectfully,

O. H. TITTMANN, *Superintendent.*

To Hon. OSCAR S. STRAUS,  
*Secretary of Commerce and Labor.*

## CERTIFICATION.

---

ANNAPOLIS, MD., *November 10, 1908.*

The following publication is certified to contain correct technical descriptions of all boundaries and landmarks established in the waters of Wicomico County by the Maryland Shell Fish Commission in cooperation with the United States Coast and Geodetic Survey.

C. C. YATES,  
*Chief of Coast and Geodetic Survey Party,  
Assistant, Coast and Geodetic Survey.*

---

ANNAPOLIS, MD., *November 10, 1908.*

Examined and certified to be correct.

WALTER J. MITCHELL,  
CASWELL GRAVE,  
BENJAMIN K. GREEN,  
*Maryland Shell Fish Commission.*  
SWEPSON EARLE,  
*Hydrographic Engineer.*

NOTE.—As required by law, certified copies of this publication and of the charts of the natural oyster bars of "Wicomico County and Adjacent Waters" were filed in the office of the clerk of the circuit court of Wicomico County and in the office of the Board of Shell Fish Commissioners, at Annapolis, on December 1, 1908.

# SURVEY OF OYSTER BARS, WICOMICO COUNTY, MD.

## INTRODUCTION.

### PUBLICATIONS.

The preparation of publications relating to the survey of the oyster bars of Maryland has been divided between the Government and the State in accordance with the laws<sup>a</sup> authorizing the work and the natural division of the surveying operations of the cooperating forces.

The publications prepared and issued by the Government under the direction of the Superintendent of the Coast and Geodetic Survey consist of a series of charts and a technical report for each county surveyed.<sup>b</sup> The charts show all legal boundaries of oyster bars within the adopted boundaries of the waters opened up for leasing with each county, and the location of all landmarks (Coast and Geodetic Survey triangulation stations) used as a foundation for the delineation of these various boundaries. The technical report gives technical and legal descriptions of all oyster bar and other boundaries, and descriptions of all landmarks shown on the charts, and includes the report<sup>c</sup> of the representative of the Coast and Geodetic Survey in charge of the work of that Service in cooperation with the Bureau of Fisheries and the Maryland Shell Fish Commission. These charts and technical reports are prepared and certified for file with the courts and the Commission, as required by the laws of the State, and contain all information necessary to make a permanent record of the work of the Commission and the Government for all future requirements of the courts, or for any resurveys that may become necessary.

The part prepared and issued by the State under the direction of the Shell Fish Commission consists of an annual report<sup>d</sup> of all the operations of the Commission performed under the provisions of the laws of Maryland,<sup>e</sup> including results of biological

<sup>a</sup> See Appendix A for laws relating to the cooperation of the Coast and Geodetic Survey and Bureau of Fisheries with the Maryland Shell Fish Commission.

<sup>b</sup> These charts and technical reports can be obtained by application to the Superintendent of the Coast and Geodetic Survey, at Washington, D. C. The publications ready for issue are those for Anne Arundel, Somerset, and Wicomico counties. Those for Worcester, Calvert, St. Marys, and Charles counties are now being prepared.

<sup>c</sup> See page 13 and the progress map attached to this publication.

<sup>d</sup> These reports can be obtained by application to the Shell Fish Commission, Annapolis, Md. They are issued annually in October, and the first report is now available for distribution.

<sup>e</sup> See Appendix B for an extract from the "First Report of the Maryland Shell Fish Commission," giving a concise summary of the "Haman Oyster Culture Law."

and economic oyster investigations, methods and results of the hydrographic survey of the boundaries of oyster bars and crab bottoms, the administrative report and financial statement of the Commission, information relating to oyster culture, methods of surveying and leasing of oyster lots, and much other important matter of legal and scientific value.

These two sets of publications are planned and arranged to supplement each other without unnecessary duplication, and when combined they form a complete report of operations, methods, and results of the work of both the Government and State.

#### COOPERATION OF THE COAST AND GEODETIC SURVEY.

The work of the Coast and Geodetic Survey, as the name of the Service indicates, includes a survey of the coasts of the United States made on a geodetic basis. This has involved the gradual construction of a great framework of interstate triangulation for use as a foundation for detail hydrographic and topographic surveys, from which there has been compiled and published a complete set of charts of the coasts of the United States, including all waters of Maryland where oysters grow. This existing triangulation, hydrography, and topography is essential for a correct and practical survey of natural oyster bars; and it being one of the fundamental functions of the Coast and Geodetic Survey to furnish such data, the cooperation of the Coast and Geodetic Survey with the Bureau of Fisheries and the Maryland Shell Fish Commission is a practical and natural development of Government work leading to the conservation and increase of the supply of food.

#### COOPERATION OF THE BUREAU OF FISHERIES.

The Bureau of Fisheries has cooperated with the Coast and Geodetic Survey and the Maryland Shell Fish Commission principally as an adviser in matters relating to the biological and economic survey of oyster bars and the methods to be employed for that purpose.<sup>a</sup> A steam launch, rowing boat, and certain apparatus have also been furnished.

The primary function of the Bureau of Fisheries is to increase the productiveness of marine and fresh waters by such measures as may be best suited to the purpose, and the services rendered in connection with the survey of the oyster bars of Maryland are strictly in line with the fundamental law under which it acts. In certain States other than Maryland similar work has been conducted by the Bureau acting independently, the same ends being attained at greater expense to the Government.

#### GENERAL REMARKS.

A brief account of the particular surveying operations which constitute an "oyster survey" as now being carried on in Maryland will assist in the interpretation of records contained in the technical part of this report, and will be of interest to many who may not understand the necessity for the great amount of work being done or its complicated character.

To those familiar with methods used in surveying and charting the characteristic features of large bodies of water there is an evident necessity for the various operations

<sup>a</sup> Hon. George M. Bowers, Commissioner of Fisheries, has detailed for this service Dr. H. F. Moore, Assistant, Bureau of Fisheries.

performed, especially when it is known that the boundaries of the public oyster bars and of the private lots leased for purposes of oyster culture must be surveyed and charted with the greatest attainable accuracy. To others it will be sufficient to state that the actual experience gained from oyster surveys in other States has proven that in order to avoid endless dissatisfaction and litigation, it is necessary to accurately locate and permanently establish oyster boundaries as is now being done in Maryland.

Such refinement of survey work as that demanded by the conditions of an oyster survey when carried on at considerable distances offshore can only be obtained by the use of a system of triangulation as a frame work or foundation. Therefore, a triangulation survey including the permanent marking of the positions of landmarks with monuments and a record of the descriptions of their locations for future recovery is a necessary operation of a complete oyster survey.

The technical records which established the relation between the offshore oyster boundaries and triangulation landmarks are sufficient for the requirements of engineers in making resurveys, but do not supply the needs of others who are interested in the same boundaries by reason of their occupation, as oystermen concerned as to the public oyster bars, or oyster culturists concerned as to the barren bottoms. For these it is necessary to have the charts of the survey show the relation of the shore line and other topographic features to the boundaries of the public oyster bars and private oyster farms. Therefore, a topographic survey is a necessary operation of a complete oyster survey.

In the settlement of the important question of what is, or what is not, a natural oyster bar, and in the consideration of bottoms to be selected for purposes of oyster culture, information as to the depth of water and the character of the bottom is required. Therefore, a hydrographic survey is a necessary operation of a complete oyster survey.

Consequently, the necessary components of a satisfactory foundation for a complete oyster survey are the three classes of survey operations technically named triangulation, topography, and hydrography, or, stated in another way, the foundation of a practical oyster survey includes the surveying operations usually followed by the Coast and Geodetic Survey leading up to the preparation and publication of nautical charts.

Having obtained this cartographic survey for a foundation, partly by new work and partly from records of previous work of the Government, the combined operations<sup>a</sup> making up an "oyster survey" are completed by superimposing on this foundation special surveys and investigations pertaining particularly to oysters or other shell fish.

The special surveys pertaining to oysters furnish information as to the location and outline of oyster-shell bottoms, and are carried on by the sounding boat party in addition to the usual hydrographic work.<sup>b</sup> This operation consists of the observation and record of the character of vibration of a wire and chain apparatus which is dragged over the bottom, the vibrations or lack of vibrations indicating the presence and quantity of shells or absence of shells.

<sup>a</sup> See Appendix C of this publication for "Statistics of results of combined operations of the Government and State."

<sup>b</sup> See pages 104 to 123 of "First Annual Report of Maryland Shell Fish Commission."

*Survey of Oyster Bars, Wicomico County, Md.*

The special oyster investigations<sup>a</sup> consist of the actual determination of the kind and quantity of oysters on the bottom, and such economic and biological studies of the supply of oyster food, density of water, character of the bottom, and other important matters as affect the growth of oysters. In this work the oyster investigation stations are located and buoyed by the hydrographic party while engaged in the survey of the oyster-shell limits. They are selected with the view of obtaining characteristic data which can be used for the interpretation of the recorded vibrations of the chain apparatus at all other points covered by the survey.

The actual surveying operations and oyster investigations having been completed for any one county, there still remains technical work of nearly equal magnitude to that described.<sup>b</sup> This work consists of the preparation of charts and technical descriptions of boundaries and landmarks for record and publication by the Government, the manufacture and planting of "State buoys" at all corners of the oyster-bar boundaries, the preparation of that part of the annual report of the Commission covering the oyster investigations, the making of the leasing charts and finished projections, and finally the survey and record of the boundaries of oyster lots leased from the State by private individuals for the purposes of oyster culture.

From the foregoing account it can be seen that a complete oyster survey properly conducted so as to answer all practical requirements of the present and permanency of results for the future is a very complicated affair, involving many lines of surveying and other scientific work, and requiring the professional services of experts in the various operations of cartographic surveying and shell-fish investigations.

<sup>a</sup> See pages 30 to 67 and 129 to 199 of "First Annual Report of Maryland Shell Fish Commission."

<sup>b</sup> No mention is made here of the large amount of administrative work of the Commission, which is greatly complicated and increased by the economic and political effect of the oyster-survey operations on many thousands of people whose interests are more or less involved.

# REPORT OF THE WORK OF THE COAST AND GEODETIC SURVEY.

## INSTRUCTIONS.

The two following letters, together with the laws<sup>a</sup> of the United States relating to the subject, constitute the "instructions" received by the chief of the Coast and Geodetic Survey party engaged on work in connection with the Maryland Shell Fish Commission. They are short and definite, but furnish ample authority and leeway for all legitimate development of the cooperation of the Government and the State in the survey of oyster bars. The "free hand" permitted by these orders, together with the aid and many valuable suggestions received from the officers of the Survey at Washington, has proved very beneficial to the work, and is greatly appreciated.

DEPARTMENT OF COMMERCE AND LABOR,  
OFFICE OF THE SECRETARY,  
*Washington, June 2, 1906.*

SIR: In reply to your letter of May 28, requesting me to designate officers of the Coast and Geodetic Survey and of the Bureau of Fisheries to cooperate with the State of Maryland in making survey of and locating the natural oyster beds, I have the honor to inform you that Mr. C. C. Yates will be designated to cooperate on the part of the Coast and Geodetic Survey as soon as Congress makes the provisions of the act effective by providing an appropriation for the purpose.

Respectfully,

LAWRENCE O. MURRAY, *Assistant Secretary.*

His excellency Hon. EDWIN WARFIELD,  
*Governor of Maryland, Annapolis, Md.*

DEPARTMENT OF COMMERCE AND LABOR,  
COAST AND GEODETIC SURVEY,  
*Washington, July 3, 1906.*

SIR: Upon the receipt of these instructions you will surrender the command, accounts, etc., of the steamer *Endeavor* to the Hydrographic Inspector. \* \* \*

As soon as this transfer is completed you will enter upon the duties of Coast Survey representative on the Shell Fish Commission of Maryland.

You will consult the commissioners, prepare a programme of work, and submit estimates in the usual form.

You are authorized to come to Washington for consultation from time to time as may be necessary.

\* \* \* \* \*

Very respectfully,

O. H. TITTMANN, *Superintendent.*

Capt. C. C. YATES,  
*U. S. C. and G. S. Steamer Endeavor, Baltimore, Md.*

## ORGANIZATION AND EQUIPMENT.

The personnel and occupation of the party of the Coast and Geodetic Survey have remained practically unchanged since the beginning of the "oyster survey." Besides the chief of party, it consists of the necessary triangulators, computers, draftsmen, and temporary employees required to carry on both the surveying operations in the

<sup>a</sup> For these laws see Appendix A.

field and the preparation for publication of charts and technical records in the Office at Washington.

The equipment for the work of the party has been ample and satisfactory. The large living and office quarters furnished the Government on the Maryland Shell Fish Commission house boat *Oyster* have been very convenient for the work, besides facilitating efficient cooperation with the surveying and oyster investigation parties of the State. In addition to the accommodations on the *Oyster*, the Coast and Geodetic Survey party has had the constant use of the large steam launch *Inspector* and several other boats furnished by its own Service, and the occasional use of the Bureau of Fisheries launch *Canvasback*<sup>a</sup> and the steamer *Governor McLane*<sup>b</sup> of the State fishery force.

The greater part of the equipment of instruments for the operations of both the Government and State has been furnished by the Coast and Geodetic Survey and consists of all necessary theodolites, levels, sextants, drafting instruments, hydrometers, etc., required for all field and office work.

#### CHRONOLOGICAL STATEMENT OF WORK.<sup>c</sup>

On June 20, 1907, the work in connection with the publication of the "Charts of Natural Oyster Bars" and report<sup>d</sup> of "Survey of Oyster Bars" for Anne Arundel County was finally completed and the survey records and reports for that county were ready for filing in the archives of the Survey at Washington.

In addition to this work, a Coast and Geodetic Survey signal-building party was engaged in the erection of triangulation signals in Somerset County from May 2 to June 25 in cooperation with a signal-building party of the Shell Fish Commission.

From June 25 until the practical completion of the field work in Somerset and Wicomico counties on November 6, the usual routine of field and office work was followed without material interruption except that resulting from the moving of the house boat *Oyster* from Crisfield to Manokin River on July 13, then to Piney Island on August 27, and to Wicomico River on August 30, where she remained until her removal to Nanticoke River on September 30, 1907.

From this latter date the work in Wicomico County predominated until the field surveys of that county were completed, when the entire party left by rail for Worcester County, it being impracticable to move the house boat to the waters of that locality.

At the close of the survey work in Worcester County in the last part of December, office work relating to Somerset and Wicomico counties was begun at Baltimore,<sup>e</sup> and was continued without material interruption until March 23, 1908, when a subparty went to Worcester and Somerset counties to finish some details of field work in those sections required for the preparation of the technical reports and oyster charts.

<sup>a</sup> By courtesy of Dr. H. F. Moore, U. S. Bureau of Fisheries.

<sup>b</sup> By courtesy of Capt. James A. Turner, commanding.

<sup>c</sup> The field and office work relating to Somerset County is so intermixed with that of Wicomico County that this statement includes the work of both counties.

<sup>d</sup> See that report for an account of the work from July 3, 1906, to June 20, 1907.

<sup>e</sup> Office rooms were furnished for the work of the Government party in the "old court-house" and afterwards in the new custom-house by courtesy of Hon. William F. Stone, collector of customs.

The very large amount of work of computation and drafting necessary to make the results of the survey of the previous season available for publication was nearly completed on May 2, 1908, when it was transferred to the Government quarters on the house boat *Oyster*, which left Baltimore on the same day with the party and outfit for her anchorage off Solomons Island, in the Patuxent River.

On July 1, 1908, certified copies of the technical report and oyster charts of Somerset County were filed in the office of the clerk of the circuit court of Somerset County and in the office of the Board of the Shell Fish Commissioners, at Annapolis, thus opening that county for oyster culture on that date.

STATISTICS.<sup>a</sup>

Landmarks and triangulation signals erected.....	30
Monuments planted to mark triangulation stations.....	30

Progress map prepared for publication.....	1

GENERAL STATEMENT.

The results obtained from the work of the Coast and Geodetic Survey in Wicomico County in cooperation with the Bureau of Fisheries and the Maryland Shell Fish Commission need no other summary than is indicated by the published "Charts of Natural Oyster Bars" and the scheme of hydrographic projections and triangulation stations shown on the progress map at the end of this report.

The triangulation has been carried on in accordance with the standard methods of the Coast and Geodetic Survey, making this work and that of the "Descriptions of Triangulation Stations" of permanent value, not only to the State of Maryland in the survey of her oyster bars, but also to the Government for any future work it may do in the regions covered by the oyster survey operations.

The hydrographic projections and published charts were prepared with all the accuracy permitted by their large scale, especially as to the boundaries of the various

<sup>a</sup> These statistics only include field and office work directly performed by the party of the Coast and Geodetic Survey in connection with the oyster survey of Wicomico County, and do not include the many thousands of soundings and examinations of the character of the bottom made by the engineers of the Commission, which are of considerable value to the Coast and Geodetic Survey as hydrographic records for future use in connection with the preparation of new editions of charts of the waters of Maryland.

shell-fish bottoms in relation to landmarks, but this accuracy of location on the charts is further added to by published technical descriptions which should minimize the probability of any future dispute as to either landmarks or boundaries.

Stated another way and quoting from the report of the "Survey of Oyster Bars of Anne Arundel County:"

The geographic positions of the permanent landmarks and signals have been determined with the usual precision of a trigonometric survey, and their locations at all points necessary to provide ample foundation for the surveying and charting operations permitted great accuracy of definition and location for the natural oyster bar and other boundaries established. At the same time, the very important element of permanency of the positions of boundaries has been secured, as the relocation of geodetic positions can always be accomplished by a competent surveyor, even though the original landmarks and monuments have been washed away, as has been the fate of hundreds of such points established by the Coast and Geodetic Survey on the shores of the Chesapeake Bay during the last sixty-five years.

In fact, when the survey of the oyster bars of Maryland is completed, it is believed that it will stand the test of time and practical use as a working foundation for whatever form the oyster legislation of the future may assume, and that the doing of the work systematically and accurately, once for all, not only means a better foundation of a great oyster industry by irradicably locating the natural oyster bars for the use of the public, but also a better and more permanent superstructure of oyster culture for the individual by the reason of the integrity of the foundation on which it stands.

Before ending this report the representative of the Coast and Geodetic Survey wishes to renew his statement of appreciation of the courteous assistance received from various Government and State officials and others interested in the oyster industry of Maryland, especially to the following:

To his colleague from the Department of Commerce and Labor, Dr. H. F. Moore of the Bureau of Fisheries, whose well-known scientific knowledge of all matters relating to oysters has been of great value to the work.

To Mr. Walter J. Mitchell, chairman of the Maryland Shell Fish Commission, who, by his administrative ability in carrying out the complicated requirements of the oyster laws and by his unflinching tact, has made the cooperation of the various services engaged on the work both agreeable and effective.

To Dr. Caswell Grave, secretary of the Commission, who, as editor of the Commission's annual report and commissioner in charge of the biological and economic oyster investigations, has been brought into constant contact with the Government work and aided its operations in every way.

To Benjamin K. Green, treasurer of the Commission, who has looked after the equipment and commissary of the house boat in such a way as to add greatly to the comfort and convenience of the party of the Coast and Geodetic Survey.

To Swepson Earle, hydrographic engineer to the Commission, whose knowledge of the work from former service in the Coast and Geodetic Survey has greatly facilitated his practical use of the technical data furnished by the Government.

To Thomas H. Robinson, counsel to the Commission, for courteously furnishing valuable information relating to county boundaries.

And to the many others connected with the Commission or who as residents in the locality where the work was being carried on have greatly assisted by furnishing important information or willing services.

## CHARTS AND MAPS.

### CHARTS OF NATURAL OYSTER BARS.

The charts<sup>a</sup> of the natural oyster bars of "Wicomico County and Adjacent Waters," published by the Coast and Geodetic Survey from results of surveys of the Government in cooperation with the Maryland Shell Fish Commission, consist of two sheets covering the eastern shore of Nanticoke River and the northern shore of Wicomico River, including all oyster-producing bottoms of Wicomico County. They are published on a scale of 1 part in 20,000 (approximately  $3\frac{1}{4}$  inches to a statute mile) and are constructed on polyconic projections and based on the United States standard datum of the Coast and Geodetic Survey.

These charts show all oyster bars and other boundaries established by the Commission, and are certified for the purpose of filing in the office of the clerk of the circuit court of Wicomico County and in the office of the Commission at Annapolis, as required by the oyster laws of Maryland.

In addition to the oyster-bar and other boundaries, the charts show the location and name of all landmarks (U. S. Coast and Geodetic Survey triangulation stations) used in making the survey, together with the hydrography and topography<sup>b</sup> necessary to make the technical definitions and delineations of boundaries readily understandable both by the people engaged in the oyster industry and the general public who may become interested through leasing of barren bottoms for oyster culture.

The names of the oyster bars are those used locally, as nearly as could be ascertained by the hydrographic engineer of the Commission. When there was no local name in common use, a name was selected from one of the prominent features of the vicinity. By the use of recognized names or those that would naturally suggest certain sections of water, it is believed that much confusion will be avoided in the location on the charts of the oyster bars, especially by those not familiar with the use of maps.

The corners of the oyster bars are numbered from 1 to the total number of corners in each area under consideration. Where boundaries adjoin, making one point a corner of two or more oyster bars, these points have two or more numbers, each number corresponding to the bar in which the figure is located. The numbers of the corners correspond with the technical and legal descriptions of this publication under the headings of "Boundaries of natural oyster bars."

The landmarks and oyster bars have been grouped in the "Contents" of this publication in accordance with the charts upon which they are shown. To find a

<sup>a</sup> These charts can be obtained by application to the Superintendent of the Coast and Geodetic Survey, at Washington, D. C.

<sup>b</sup> Much of the details of the inshore topography was obtained from the excellent map of Wicomico County prepared and published by the Maryland Geological Survey under the direction of Dr. William Bullock Clark from surveys of the Maryland Geological Survey in cooperation with the U. S. Geological Survey.

particular oyster bar or landmark which is only known by name, consult the "Contents" and the desired chart and general location will be indicated. To find the name of a bar or landmark which is only known by location, consult the progress map at the end of this publication for the number of the chart on which it is to be found, and then examine the known locality on the chart for the name of the bar or landmark in question.

The contours on the charts showing the depth of water at mean low tide have been taken from the hydrographic sheets of former work of the Coast and Geodetic Survey. Four curves were selected as being the most convenient for taking off from the original hydrographic sheets and the ones of greatest value to those interested in shell-fish industries. The 1-fathom contour (6 feet) corresponds in a general way to the outer limits of the crab bottoms, while the waters outside of this curve and inside the 5-fathom contour (30 feet) practically include all the oyster bars surveyed. The 3-fathom contour (18 feet) furnishes the curve of about the average depth of water on the oyster bars and the 10-fathom contour (60 feet) serves in a general way to indicate the outer limits of probable oyster culture.

The boundaries of the waters within the "territorial limits of the county" opened up for the leasing with Wicomico County are plainly indicated on the charts. A description of this boundary is given in this publication under the heading "Boundaries of the county waters."

The areas in acres of the oyster bars were determined under the direction of the hydrographic engineer of the Commission by two independent planimeter measurements of the areas as delineated on the smooth projections of the Coast and Geodetic Survey. These areas are given in small figures in parentheses on the face of the chart and are usually located within the boundaries of the different areas.

The symbols used on the charts for the different kinds of boundaries, triangulation stations, contours of depth of water, etc., require no other explanation than that given in the legend and other notes on the face of the charts.

#### LEASING CHARTS.

The leasing charts of Wicomico County, like those for Anne Arundel and Somerset counties, have been prepared under the direction of the hydrographic engineer of the Commission. These charts are constructed on polyconic projections and based on the United States standard datum of the Coast and Geodetic Survey. They are made on the scales of 1 part in 5,000 or 1 part in 10,000, as the needs of oyster culture may require. Anne Arundel County required 13 leasing charts, Somerset County 12, and Wicomico County 2 to cover their oyster bottoms.

These charts show all the oyster bars, crab bottoms, and clam beds and other boundaries established by the Commission, and also all boundaries of oyster lots leased for the purpose of oyster culture, thus making them comprehensive and valuable records of the results of the operations of the oyster-culture laws.

The lots leased under the provision of the "old 5-acre law" are frequently of irregular shape, but the lots leased under the provision of the new oyster laws must be of rectangular shape by the terms of that act. For this latter purpose the leasing charts have been divided by parallels of latitude and meridians of longitude into small

rectangles of 1 acre or 5 acres, as may be best suited to area under consideration, and prospective leaseholders by the rules of the Commission are compelled to select whole rectangles as far as practicable.

For reasons of the present changeable nature of the number of lots leased and the large number of charts required, the leasing charts are not likely to be published for some years, but they can be seen at any time on file at the offices of the Commission, in Annapolis.

#### PROJECTIONS.

The polyconic projections<sup>a</sup> covering Wicomico County waters are 2 in number and on the scale of 1 part in 10,000. They were constructed by draftsmen of the Coast and Geodetic Survey, who also plotted the sextant positions which determine the location of the legal boundaries of the oyster bars as delineated by the Shell Fish Commission.

A copy of each of these projections, with all the plotted positions of triangulation stations, shore line, sextant positions, and boundaries of oyster bars, was made under the direction of the hydrographic engineer of the Commission by pricking through with a sharp needle the intersections of the projection lines and all other points as plotted on the original sheets.

These projections (in duplicate) are the original records of all oyster bar and other boundaries established by the Commission, one set being filed in the archives of the Coast and Geodetic Survey, at Washington, and the other set in the office of the Shell Fish Commission at Annapolis.

#### PROGRESS MAPS.

The progress map to be found at the end of this publication is on a scale of 1 part in 100,000, and shows in outline the work accomplished by the U. S. Coast and Geodetic Survey in Wicomico County and contiguous waters. It gives the scheme of all the charts and smooth projections constructed in connection with the survey, the location and names of all triangulation stations used as a basis for the surveying work, and the "boundaries of county waters" established by the Commission for the purpose of carrying out the laws of Maryland relating to oyster culture.

Besides indicating the amount of work done by the Coast and Geodetic Survey in connection with the work of the Shell Fish Commission, this progress map will be of special value for index purposes to engineers and others searching for the particular chart or projection covering the locality of the oyster bars or landmarks that may be under consideration.

The progress map<sup>b</sup> accompanying the "First Annual Report of the Maryland Shell Fish Commission" was prepared under the direction of the hydrographic engineer of the Commission. It is on the scale of 1 part in 400,000 and shows the outline of the tide-water counties of Maryland, with shaded areas to indicate the waters already covered by the operations of the oyster survey of Maryland.

<sup>a</sup> For the scheme of these projections see the progress map at the end of this publication.

<sup>b</sup> This map and report can be obtained by application to Maryland Shell Fish Commission, at Annapolis, Md.

## BOUNDARIES OF THE COUNTY WATERS.<sup>a</sup>

### WATERS WITHIN TERRITORIAL LIMITS OF COUNTY.

The laws of Maryland relating to oyster culture provide that "no person shall be permitted, by lease, assignment, or in any other manner, to acquire a greater amount of land than ten acres situated within the territorial limits of any of the counties, or one hundred acres in any other place."

The boundary line<sup>b</sup> between the waters "within the territorial limits" of Wicomico County and the waters in "any other place," as established by the Shell Fish Commission for the purpose of carrying out the oyster laws, and delineated on the charts and the smooth projections of the Coast and Geodetic Survey, is identical with the boundary line between Wicomico County and the adjacent counties of Dorchester and Somerset; therefore technically all waters opened up for leasing with Wicomico County are within the "territorial limits" of that county.

### WATERS CONTIGUOUS TO COUNTY.

The oyster laws of Maryland provide that a true and accurate delineation of all natural oyster bars shall be made on copies of charts of the U. S. Coast and Geodetic Survey, "which said copies shall be filed in the office of the said Commissioners in the city of Annapolis," and "in the office of the clerks of the circuit courts for the respective counties wherein the grounds so designated may lie."

For the purpose of carrying out the latter part of this section of the law and for the purpose of establishing the limits of the oyster-culture area to be opened up for leasing with each county surveyed, it is necessary for the Shell Fish Commission to establish a boundary line between the waters contiguous to but not within the territorial limits of each county, and the waters contiguous to but not within the territorial limits of adjacent counties. But technically, as explained under the preceding heading of "Waters within territorial limits of county," there are no "waters contiguous to the county" in Wicomico County; and therefore there are no waters opened up for leasing with that county in which a person can lease "a greater amount than ten acres."

<sup>a</sup> For a complete historical and legal description of the boundaries of the counties of Maryland, the valuable publication entitled "The Counties of Maryland—Their Origin, Boundaries, and Election Districts," prepared by Dr. Edward B. Mathews and published by the Maryland Geological Survey under the direction of Dr. William Bullock Clark, Superintendent, should be consulted, as the boundaries described in this publication have been established and technically defined for the purpose of carrying out the oyster laws of the State, and may or may not be correct for other purposes.

<sup>b</sup> See "Charts of Natural Oyster Bars," published by the Coast and Geodetic Survey, and the progress map at the end of this publication.

## LANDMARKS (U. S. COAST AND GEODETIC SURVEY TRIANGULATION STATIONS).

### EXPLANATION OF DESCRIPTIONS OF LANDMARKS.

The oyster laws of Maryland authorizing the surveys to be made by the Shell Fish Commission provide for "an accurate report of said survey, setting forth such a description of landmarks as may be necessary to enable the said board, or their successors, to find and ascertain the boundary lines of said natural oyster beds, bars, and rocks, as shown by delineation on the maps and charts." The law of the United States authorizing the cooperation of the Department of Commerce and Labor in the survey of natural oyster bars of Maryland provides for the erection of "such structures as may be necessary to mark the points of triangulation, so that the same may be used for such future work of the Coast and Geodetic Survey as the said Bureau may be hereafter required to perform in prosecuting the Government coast survey of the navigable waters of the United States located within the State of Maryland."

Under the provisions of the sections of the laws stated above, the markings and descriptions of landmarks must be sufficient for the present and future needs of both the Government and the State. With this end in view, considerable work has been expended in erecting permanent monuments at the triangulation stations and in the proper description of their location.

An effort has been made to arrange the descriptions of locations of landmarks in a uniform and logical manner. The descriptions start with the assumption that the individual seeking to find a landmark has only an indefinite idea of its location. They then gradually proceed from general descriptions of the surroundings of a landmark to the specific details of the character of the center and reference markings. An examination of the descriptions themselves will best indicate the method followed.

The heading of each description is the name by which the landmark or triangulation station is known and designated in all work and records of the Government and State.

Under the heading of "Locality" the first paragraph gives a description of the general locality of the landmark and the serial number of the published "Chart of Oyster Bars" of Maryland which best shows its location. The published charts are on the large scale of 1 part in 20,000, and show the location of the triangulation stations so clearly that in many cases the written descriptions will not be required to find them.

Under the same heading of "Locality" the second paragraph furnishes the description of the immediate locality of the landmark and refers to the bearing and distance of standard cement monument marking the reference station, as it is the first object that is likely to catch the eye when the immediate vicinity of the desired station is reached.

Under the heading of "Marks" a description is given of the character of the markings of the "observed station" and the reference station. It will be noted that, although

the "observed station" is the one "occupied" and "observed on" for horizontal angles, and also the one whose geographic position is computed, frequently it is not marked as well as the reference station, and in many instances has only a pine stub to indicate its position. This is the case for the reason that the necessity of intervisibility of landmarks usually made it compulsory to locate these stations on edges of banks and ends of points of land, which in Chesapeake Bay and tributaries generally means that they will be washed away in a short period of years. The past experience of the Coast and Geodetic Survey in this region has shown the necessity of reference marks, if the frequent reestablishment of a new framework of triangulation is to be avoided.

All the marks designated in the descriptions as "the center point of triangle on standard cement monument" are exactly alike. These monuments are made of cement, sand, and gravel, and are 2 feet long and 8 inches square at top and bottom. Their tops are all marked with the same brass mold and show a center hole surrounded by a triangle, with the letters "M. S. F. C." arranged around the vertex and the letters "U. S. C. S." underneath the base of the triangle. The center hole is always in the center of the top of the monument by construction, and if this is found to have been broken off without disturbing the bottom, the center of its square section can be used as the location of the station.

All the "standard cement monuments," whether used for marking the "observed station" or "reference station," have been planted upright in exactly the same manner, with their tops projecting 3 or 4 inches above the surface of the ground.

Therefore, as the above facts in reference to the "standard cement monuments" are a constant element in all cases, the repetition of these facts in the description of stations is made needless by this one statement.

It is the expectation that the reference stations,<sup>a</sup> the character of which is explained above, will be used in many cases in the near future in the place of the "observed stations." This has been made possible by the careful measurements of direction and distance of these stations from the "observed station," which are recorded under the heading of "References."

Under the heading of "References" are given the directions and distances of all objects that might be useful in locating the stations when the surface marks can not be found. It is also contemplated that for general purposes of topography, hydrography, or location of boundaries of oyster bars these references will be sufficient in many cases to relocate the position of an "observed station" or "reference station" when both of them have been destroyed.

The first reference object given in the descriptions is always a triangulation station visible from the station being described. Its direction is taken as being  $0^{\circ} 00' 00''$ , and the directions of all other objects are measured from it as an initial point, the angles being taken in a clockwise direction (left to right).

The true bearing<sup>b</sup> of the initial object is always given in parenthesis alongside the name. This furnishes means for the calculation of the bearings of any of the other

<sup>a</sup>To obtain the geographic positions of any of the "observed stations" or of the "reference stations," application should be made to the Superintendent of the Coast and Geodetic Survey at Washington, D. C.

<sup>b</sup>The mean magnetic variation for Wicomico County is  $5^{\circ} 45'$  west of north (1908) and is increasing at the rate of  $3'$  yearly.

reference objects for the purposes of locating a station by compass bearings or for the relocation of corner buoys of oyster-bar boundaries by the method of horizontal angles described in this publication under the heading of "Boundaries of oyster bars."

The distances in the last column under "References" are given in three different units, which vary according to their accuracy. The "miles" are statute miles and may be considered only as rough estimates. The "yards" are more accurate, but must be looked on as results generally obtained by pacing or careful estimating. The "meters," however, are accurate to the degree indicated by their decimals and in every case have been measured with a steel tape. In the same manner the accuracy of the directions are indicated by the refinement of direction with which they are recorded.

DESCRIPTIONS OF TRIANGULATION STATIONS.

COW.

*Locality.*—Western shore Nanticoke River on Mink Point about ¼ mile east of entrance to Cow Creek. (See Charts Nos. 11 and 12.)

Observed station is on a very soft marsh point at the outer edge of water bushes about 5 yards back from the shore to the east, 15 yards from extreme end of point to the southeast, and 15 yards from the shore to the southwest. No permanent reference objects near station. Cement monument marking reference station is 8.68 meters northwest of observed station.

*Marks.*—Observed station is a nail in a pine stub flush with ground. Reference station is center point of triangle on standard cement monument.

*References.*—

OKAY.

*Locality.*—Western shore of Nanticoke River about ⅓ mile south of Swan Creek Cove on Marsh Point. (See Chart No. 11.)

Observed station is on marsh land about 2 feet above and 10 yards back from high-water mark. A shanty known as Insleys watch house stands about 35 yards north of observed station. No other permanent reference objects near station.

*Marks.*—Observed station is center point of triangle on standard cement monument.

## GOVER.

*Locality.*—Northwestern shore of Nanticoke River 1¾ miles west-northwest of entrance to Wetipquin Creek and ½ mile north of cove named Perch Haul. See Chart No. 11.)

Observed station is on a point of marsh covered with grass and water bushes, and is about 15 yards northwest from extreme end of point. A shanty stands among the bushes and small trees about 200 yards to the west-southwest. A clump of about 50 pine trees stands about ¼ mile west and another clump stands about ¼ mile northwest.

*Marks.*—Observed station is center point of triangle on standard cement monument.

STREETT.

*Locality.*—Northwestern shore of Nanticoke River on point on southwest side of entrance to Jacks Creek. (See Chart No. 11.)

Observed station is on a marsh and grass point 7 yards west from its extreme end and about 4 yards from each side of point to north and south. Cement monument marking reference station is 11.89 meters west of observed station.

*Marks.*—Observed station is nail in pine stub flush with ground. Reference station is center point of triangle on standard cement monument.

EARLE.

*Locality.*—Southeast shore of Nanticoke River about one mile below Sandy Hill wharf. (See Chart No. 11.)

Observed station is on sand and grass land between river and pine grove, and about 80 yards back and 5 feet above high-water mark. A white oak tree about 2½ feet in diameter stands between station and river and another and larger white oak tree stands about 15 yards to the northeast. There is a shanty about 20 yards to the west and a sand beach northwest of the station.

*Marks.*—Observed station is center point of triangle on standard cement monument.

## NANTICOKE CHURCH.

*Locality.*—Eastern shore of Nanticoke River in town of Nanticoke, about ¼ mile back from river and ¾ mile northeast of Roaring Point. (See Charts Nos. 11 and 12.)

*Marks.*—Observed station is center point of spire of church known as "Nanticoke Methodist Episcopal Church."

*References.*—None necessary.

## CRAB.

*Locality.*—Upper end and western shore of Tangier Sound on eastern side of Bloodworth Island about  $2\frac{5}{8}$  miles southeast of Sharkfin Shoal Light and about halfway between Piney Island Cove to north and Great Cove to south. (See Chart No. 12.)

Observed station is about 15 yards from high-water mark to the northeast and about 35 yards from the shore to the east. A small flat-roof crab house stands about 80 yards to the north-northeast and another crab house about twice the distance in the same direction.

*Marks.*—Observed station is center point of triangle on standard cement monument.

*References.*—

## SHARKFIN SHOAL LIGHT.

*Locality.*—Northern end of Tangier Sound about equally distant from entrances of Hooper Strait, Fishing Bay, and Nanticoke River. (See Chart No. 12.)

*Marks.*—Observed station is center point of black lantern on hexagonal screw pile known as "Sharkfin Shoal Light."

*References.*—

"Great Shoals Light" (N 81° 45' E).....				5 $\frac{1}{8}$ miles.
---	--	--	--	------------------------

## HEAD.

*Locality.*—Upper end of Tangier Sound, on southern part of peninsula known as "Bishops Head," situated between Hooper Strait and Fishing Bay. (See Chart No. 12.)

Observed station is on eastern side of marsh land about  $\frac{1}{2}$  mile north of extreme southerly end of Bishops Head and about 15 yards east of two crab houses. It is about 15 yards southwest of high-water mark, behind water bushes which skirt the shore. Cement monument marking reference station is 13.41 meters west from observed station.

*Marks.*—Observed station is a nail in a pine stub flush with ground. Reference station is center point of triangle on standard cement monument.

## FROG.

*Locality.*—West shore of mouth of Nanticoke River, on the southeasterly point of Clay Island, known as "Frog Point." (See Chart No. 12.)

Observed station is on a marsh point about 25 yards back from extreme end of point, 20 yards from the east side and 25 yards from the west side. Water bushes abound back of station. There are no permanent reference objects near station. Cement monument marking reference station is 13.10 meters north of observed station.

*Marks.*—Observed station is nail in stub flush with ground. Reference station is center point of triangle on standard cement monument.

*References.*—

## ROAR.

*Locality.*—Eastern shore of Nanticoke River on point of land known as Roaring Point, and about ¼ mile north from outer end of Roaring Point wharf. (See Chart No. 12.)

Observed station is 30 yards to the east of the extreme end of the point and on a sandy knoll about 5 feet above high-water mark. It is about 20 yards back from high-water mark on the north side and about 40 yards back from high-water mark on south side of the point. Pine woods stand about 150 yards inshore from station.

*Marks.*—Observed station is center point of triangle on standard cement monument.

NANTI.

*Locality.*—Eastern side of entrance to Nanticoke River about  $\frac{1}{4}$  mile northwest of Nanticoke Point. (See Chart No. 12.)

Observed station is on grassy land about 2 feet above and 20 yards back from high-water mark. It is about midway between edge of woods on Nanticoke Point and unpainted house near poplars  $\frac{1}{4}$  mile to the north.

*Marks.*—Observed station is center point of triangle on standard cement monument.

WHITE.

*Locality.*—Eastern shore of entrance to Nanticoke River on western part of Nanticoke Point. (See Chart No. 12.)

Observed station is on a sand and grass point about 2 feet above high-water mark, 3 yards from the west side, 15 yards from the south end, and 20 yards from southeast side. Dense pine woods stand about 100 yards to the northwest, open marsh to the northeast, and a clump of about a dozen pine trees in marsh about  $\frac{3}{4}$  mile to the northeast. There is a cove about 40 yards east of the station and another point of land about 100 yards to the southeast. Cement monument marking reference station is 16.63 meters north of observed station.

*Marks.*—Observed station is a nail in a pine stub about 6 inches below surface or ground. Reference station is center point of triangle on standard cement monument.

## CHILD.

Locality.—North shore of Wicomico River about ⅞ mile north of Mount Vernon Church. (See Chart No. 12.)

Observed station is on marsh land about 2 feet above and 15 yards back from high-water mark. There is an old wharf about 300 yards to the east and at a point about 100 yards to the north, two creeks join and form a single creek about 20 feet wide which flows into the river at a point about 15 yards west of observed station.

Marks.—Observed station is center point of triangle on standard cement monument.

CREEK.

Locality.—North shore of Wicomico River about ¾ mile northwest of Mount Vernon wharf and about 1¾ miles northeast of Mount Vernon Church. (See Chart No. 12.)

Observed station is on a marsh grass and sand point making out to the south and about 10 yards from the high-water mark of each of the three sides of the point. About 10 yards west of observed station is the mouth of a creek or drain 10 feet wide which runs only a short distance inland. There are several unpainted houses within 200 yards of observed station and a lone pear tree stands about 200 yards to the north. There is a cultivated field about 150 yards back of station which extends to edge of woods ¼ mile distant.

Marks.—Observed station is center point of triangle on standard cement monument.

## WALNUT.

*Locality.*—South shore of Wicomico River about 175 yards east of Mount Vernon wharf. (See Chart No. 12.)

Observed station is on marsh land about 17 feet from shore and 50 yards west of a small creek. Several large walnut and locust trees stand about 250 yards south of station and 2 houses and 2 sheds about 250 yards to the southwest.

*Marks.*—Observed station is center point of triangle on standard cement monument.

## JONES.

*Locality.*—South shore of Wicomico River about ¼ mile west of Mount Vernon wharf. (See Chart No. 12.)

Observed station is on a knoll about 25 feet above and 30 yards to south of high-water mark, and about 200 yards to the east of a cove. The knoll on which the station is located is the highest point on the shore in this locality. Several small cabins stand to the northward about 25 yards, and a large lone cedar tree about 35 yards to the southwest.

*Marks.*—Observed station is center point of triangle on standard cement monument.

## IVEE.

*Locality.*—Southeast shore of Wicomico River about ¼ mile northwest of Mount Vernon Church. (See Chart No. 12.)

Observed station is on grass land about 1 foot above and 10 feet back from high-water mark. A small cove makes in about 100 yards east of station. A small lone pine stands about 110 yards to

the east-southeast, and a sand bluff with pine trees about 100 yards to the southwest. Beyond the woods along the beach is a bluff 15 feet high upon which are several houses.

Marks.—Observed station is center point of triangle on standard cement monument.

MOUNT VERNON CHURCH.

Locality.—Southeast side of Wicomico River about 3/8 mile back from the shore 1 1/2 miles south-west of Mount Vernon wharf. (See Chart No. 12.)

Observed station is on main road in Mount Vernon and is situated on the highest point in the vicinity.

Marks.—Observed station is center of steeple of Mount Vernon Methodist Church.

References.—None necessary.

BALL.

Locality.—Southeast shore of Wicomico River on a point of land about 1 mile northeast of Wingate Point. (See Chart No. 12.)

Observed station is on a sand and grass point making out about 100 yards west of a sand bluff. A small creek empties into the river about 10 yards to the east, and three poplars stand about 100 yards to the south. The extreme northern end of the point is about 35 yards from station and the western side is about 10 yards.

Marks.—Observed station is center point of triangle on standard cement monument.

## ROOM.

*Locality.*—Upper end and eastern shore of Tangier Sound on Halls Point. (See Chart No. 12.)

Observed station is on a bluff 15 feet high about 5 yards back from its edge. It is about 25 yards east of a clump of mulberry trees and about 15 yards north-northwest of a barn. Locust and mulberry trees stand all about station and locust bushes along the edge of the bluff. A wagon trail runs parallel to the shore about 15 yards back of station. Cement monument marking reference station is 21.45 meters south-southwest of observed station and almost in line with a large mulberry tree.

*Marks.*—Observed station is nail in center of stub with top flush with ground. Reference station is center point of triangle on standard cement monument.

*References.*—

## HAINES.

*Locality.*—Upper end and eastern shore of Tangier Sound on Haines Point, about  $\frac{5}{8}$  mile north of Deal Island wharf. (See Chart No. 12.)

Observed station is on sand and grass point about 20 yards back and 5 feet above high-water mark. Locust and water bushes stand about 20 yards to the north and the left edge of this clump is about on line with Sharkfin Shoal Light. A barbwire fence runs 3 yards east of station. Cement monument marking reference station is 9.64 meters east of observed station.

*Marks.*—Observed station is nail in pine stub in center of a drain tile with top broken off below surface. Reference station is center point of triangle on standard cement monument.

## DEAL ISLAND CHURCH.

*Locality.*—Deal Island on main road about  $\frac{1}{4}$  mile from the shore and about  $\frac{3}{4}$  mile south of Laws Thoroughfare. (See Chart No. 12.)

*Marks.*—Observed station is center of steeple on Deal Island Methodist Church.

*References.*—None necessary.

## BAR.

*Locality.*—Eastern shore of Tangier Sound on western side of Deal Island, about 1 mile northwest of entrance to Lower Thoroughfare and  $\frac{1}{2}$  mile south of Middle Creek. (See Chart No. 12.)

Observed station is about 10 yards east of high-water mark on sand and grass land back of sandy beach. The first of many tree stumps which are submerged at high water commence about 100 yards to the north and cat-tails grow abundantly back of station. Cement monument marking reference station is 6.09 meters east of observed station.

*Marks.*—Observed station is a nail in pine stub flush with ground. Reference station is center point of triangle on standard cement monument.

## BOUNDARIES OF OYSTER BARS.

### EXPLANATION OF DESCRIPTION OF BOUNDARIES.

The oyster bars of Wicomico County are 15 in number, and their total area, as marked out by buoys placed by the hydrographic engineer of the Commission, is 1,638 acres. As provided by law, the boundaries of the oyster bars are all straight lines, but they inclose areas of all shapes from triangles to complicated eight-sided figures, and of all sizes from 1,123 acres to 4 acres.<sup>a</sup> The sides vary in length from 120 to 3,800 yards, and in some cases the corners of the boundaries are practically at the triangulation stations from which they are located, while in other instances they are over 7,500 yards from the landmarks most available for the purpose of fixing their positions.

The varied characteristics of the legal boundaries of the oyster bars indicated by the above statement, together with the complicated requirements of the law under which the survey has been made and the magnitude of the work with the consequent need of fixed and uniform methods, have made the problem of describing the boundaries one of considerable difficulty and importance.

The boundaries of the oyster bars of Maryland, as established by the Shell Fish Commission and delineated on the Coast and Geodetic Survey charts and projections and on the leasing charts of the Commission, are technically defined and described by a method somewhat different from that used in other oyster surveys. But it is believed that the forms finally adopted will fulfill all needs of the survey for both the present and future.

The descriptions have been arranged in tabular form, thus avoiding many hundred repetitions of the same words by making one explanation of the tables sufficient for all oyster bars in the county.

At the top of each tabular form is given the legal name of the oyster bar to be described, its general locality, and the serial number of the "Charts of Oyster Bars" of Maryland on which its legal boundaries are shown.

The first column, under the heading of "Corner of bar," gives the number corresponding to the corner of the boundary as shown on the charts and to the number on the buoy marking the actual corner of the bar. The numbers of the corners have been assigned by naming the southernmost point No. 1, thence proceeding in a clockwise direction around the bar; but where a corner of one oyster bar is identical with the corner of the boundaries of one or more other oyster bars only the number of the corner of the oyster bar being described in the table is given in this column.

The second and third columns, under the headings of "Latitude" and "Longitude," give the geographic positions of the corners. These positions have been adopted by the

<sup>a</sup> For similar statistics for other counties that have been surveyed, see Appendix C of this publication.

Commission as the primary technical definition of the corners, and should be considered as final in case of a dispute arising from discrepancies caused by other means of location. The latitudes and longitudes given in these columns are based on the United States standard datum of the Coast and Geodetic Survey, and the points thus defined can be relocated from distant triangulation stations of the Survey, even though all the landmarks and buoys originally used for their location have been destroyed by natural causes or by acts of vandals desiring to defeat the purposes of the oyster laws of Maryland.

The fourth and fifth columns, under the general heading of "True bearing"<sup>a</sup> and the specific headings "Forward" and "Back," give bearings measured from a true north-and-south line. The three "Forward" bearings are from the corner of the boundary designated in the first column to the triangulation stations named on the corresponding lines in the last column, and the three "Back" bearings are from these same stations in the last column to the corresponding corner of boundary in the first column. The difference in minutes of arc between the forward and back bearings shown in some cases is actual and not accidental, and is due to the fact that the computations took into account the spheroidal shape of the earth.

The sixth column, under the heading of "Distance," gives the three computed distances in yards from the corner of the bar noted in the first column to the three triangulation stations named on the corresponding lines in the last column, and vice versa.

The seventh and last column, under the heading of "U. S. C. & G. S. triangulation station,"<sup>b</sup> gives the names of the landmarks from which were computed the corresponding "Latitude," "Longitude," "True bearing," and "Distance" of the "Corner of the bar" designated in the first column. A full description of the location and markings of these triangulation stations is given in another part of this publication, under the heading of "Descriptions of triangulation stations."

#### SURVEYING METHODS FOR RELOCATION OF BOUNDARIES.

There are a number of methods that can be used in the relocation of the actual boundaries of the natural oyster bars as technically described in this publication and delineated on the published charts of the Coast and Geodetic Survey and the leasing charts of the Shell Fish Commission.

The following brief descriptions of five of these more or less different methods assume a certain amount of experience and knowledge on the part of the engineer in the particular kind of surveying under consideration, and are only intended as reminders of ways and means that can be used.

There are two problems that are likely to present themselves to those interested in the boundaries of natural oyster bars. One, to determine whether the buoys marking the corners have been dragged or otherwise moved from their correct positions, and the other, to relocate or reestablish a buoy at the point from which it was removed. The different ways of solving these two problems partly depend upon the instruments possessed by the engineer and his assistants and partly on his training and experience.

<sup>a</sup> The mean magnetic variation for Wicomico County is 5° 45' west of north (1908), and is increasing at the rate of 3' yearly.

<sup>b</sup> Geographic positions of these triangulation stations can be obtained by application to the Superintendent of the Coast and Geodetic Survey at Washington.

(1) *Triangulation*.—This method is the one that will give the greatest accuracy, but on account of its requiring special data and instruments, and being an operation rarely used by engineers not engaged in geodetic surveying, it is recommended only for cases in dispute that can not be settled satisfactorily by some other method. An explanation of this class of work would be too long for a report of this sort, and those not familiar with this method are referred to the publications on the subject by the Coast and Geodetic Survey.

(2) *Hydrographic*.—This method is the most simple and satisfactory one that can be adopted if the surveyor can obtain the use of the necessary instruments and assistants. It is the one best suited for the work of the engineers of the Commission in relocating corners of boundaries, as it gives results of the accuracy ordinarily required and is rapid in execution. Besides, it has the advantage of being available whenever three triangulation stations of suitable relative positions are visible from the offshore points needing relocation.

Most navigators and others familiar with the use of a sextant are well acquainted with the graphic three-point method of fixing a position on water, and only a brief description of the operation will be stated.

In the case where there is only one engineer having a single sextant, the three-point method can be used if the two angles determining the position of a buoy are first derived from the "Forward" bearings given in the tabular forms describing the boundaries of the oyster bars. For example, take "Upper 'Stake" bar, which is the first one described in this publication, and assume that "Corner No 3," is to be examined as to its position. The angle between the two landmarks "Juliet" and "Earle" as determined from right to left from the forward bearings from this corner is  $92^{\circ} 57'$  and the angle between "Earle" and "Streett" is  $66^{\circ} 51'$ . Having these two angles, the engineer proceeds to the buoy of doubtful location and measures the actual sextant angles between the landmarks for which the calculations were made. If the measured and calculated angles do not agree the buoy is not in its correct position and the boundary corner must be relocated. This is accomplished by moving the boat about until a point is reached where the angles do agree, and this point being the desired location, the buoy can be placed in its correct position.

If the engineer can obtain the use of both a sextant and a three-arm protractor ("position finder"), the availability of the hydrographic method is increased, as the use of the protractor is essential in case of the washing away or destruction of one or more of the landmarks originally used in describing the boundaries. Under these circumstances, any three landmarks of suitable relative position that are visible from the point to be located can be utilized. For example, the engineer can proceed to the buoy of doubtful position and measure the two adjacent sextant angles between the three landmarks selected. These two angles are set off on the three-arm protractor and the actual position of the buoy plotted on the chart by shifting the protractor about until the edge of each of the three arms passes through the center of the symbols on the chart marking the position of the three landmarks selected. The center of the hub of the protractor will indicate on the chart the actual position of the buoy, and if the point thus obtained does not coincide with the true position of the corner of the boundary as given on the chart, the surveyor can proceed to locate the buoy correctly by reversing the operation. This is done by placing the center point of the hub of the

protractor over the corner of the boundary in question and measuring on the chart the two adjacent protractor angles between the three selected landmarks. One of the angles thus obtained is set on the sextant and the boat moved about until the two landmarks are shown by the sextant to subtend the same angle obtained from the protractor. The second angle is then placed on the sextant and the same operation gone through, and so on, first using one angle on the sextant then the other until a point is reached where both observed sextant angles are practically identical with the protractor angles. The point thus located is the desired one and the buoy can be placed to mark the true position of the corner of the boundary in question.

If the engineer possesses two sextants and a protractor, this problem is far easier of solution, as the two angles can be set off on separate sextants and the observer can quickly find the desired point where they agree with the protractor angles by using one sextant after the other without the need of resetting either.

If there are two observers, two sextants, and a protractor, it can be seen that the best conditions for both rapid and accurate hydrographic locations of points are attained; in fact, this is the method by which the buoys at the corners of the boundaries were originally placed by the hydrographic engineer to the Commission.

(3) *Magnetic bearings from offshore.*—This method of fixing a position on water is a simple and well-known one in navigation. It is available to anyone having a boat compass and will be of special use to the State fishery force in investigating cases where buoys are supposed to have been moved for illegal purposes.

In the case where a buoy is supposed to have been moved from its true position the observer takes compass bearings to the three landmarks given in the last column of the tables opposite the boundary corner in question. These bearings are then corrected for the local declination,<sup>a</sup> and if the results agree with the published bearings the buoy is correctly located.

In the case where the buoy is not in its correct position, or has disappeared altogether, the desired point can be determined by maneuvering the vessel until the corrected bearings agree with the ones in the tabular descriptions, when the buoy can be anchored in its proper location.

In the case where the landmarks for which the bearings are published have been destroyed or washed away, any landmarks whose positions are indicated on the charts can be used by getting their bearings directly from the chart by parallel rulers or a protractor and then applying them in the same manner as the ones published in the tables.

(4) *Magnetic bearings from shore.*—This method will be of special value to engineers having an ordinary surveyor's compass. The compass can be set over the point marking a "triangulation station" on shore, the name of which is given in the last column opposite the "corner" in question. The instrument is then set at the corresponding "back" bearing (corrected for local magnetic declination) given in the fourth column of the tables opposite the "corner" in question, and the direction thus determined will give one range on which the desired point must be located. The compass can then be moved to a second triangulation station and another range located in a similar manner. The intersection of these two range lines will give the desired point; but in general it should be checked by an additional range line determined from a third station.

<sup>a</sup> The mean magnetic variation for Wicomico County is 5° 45' west of north (1908) and is increasing at the rate of 3' yearly.

(5) *Horizontal angles measured at landmarks.*—This process is a modification of the triangulation method, and will be useful to engineers who have a transit and desire considerable accuracy.

The instrument is placed over a "triangulation station," the name of which appears in the last column of the tabular description opposite the "corner" in question. The telescope is then pointed to the landmark indicated in the "Descriptions of landmarks" as having a direction of  $0^{\circ} 00' 00''$  from the triangulation station being occupied by the transit. The tabular description of the boundaries is next examined and the "back" bearing of the questionable boundary "corner" from the landmark being occupied is taken out. The angle calculated from this "back" bearing and the bearing given in parentheses alongside the zero landmark in the "Descriptions of landmarks" is then set off on the transit, and a range line established on which the desired point must be located. A similar process is then carried on at a second station, and so on until the position of the buoy is satisfactorily fixed.

### APPENDIX A.—LAWS RELATING TO THE COOPERATION OF THE COAST AND GEODETIC SURVEY AND BUREAU OF FISHERIES WITH THE MARYLAND SHELL FISH COMMISSION.

The work of the Coast and Geodetic Survey and of the Bureau of Fisheries, in cooperation with the Maryland Shell Fish Commission, in surveying the oyster bars, establishing permanent landmarks at triangulation stations, and preparing for publication the necessary charts and technical and legal descriptions of boundaries and landmarks shown on these charts, has been executed in compliance with a request from the governor of the State of Maryland to the Secretary of Commerce and Labor, and by the authority of the following laws of the United States and Maryland:

[Act of Congress approved May 26, 1906.]

AN ACT To authorize the Secretary of Commerce and Labor to cooperate, through the Bureau of the Coast and Geodetic Survey and the Bureau of Fisheries, with the shellfish commissioners of the State of Maryland in making surveys of the natural oyster beds, bars, and rocks in the waters within the State of Maryland.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the Secretary of Commerce and Labor be, and he is hereby, authorized and directed, upon the request of the governor of the State of Maryland, to designate such officers, experts, and employees of the Bureau of the Coast and Geodetic Survey and of the Bureau of Fisheries as may be necessary to cooperate with the Maryland State board of shellfish commissioners in making a survey of and locating the natural oyster beds, bars, and rocks in the waters within the State of Maryland; and the Secretary of Commerce and Labor is hereby authorized and directed to furnish to the officers, experts, and employees of said Bureaus so detailed as aforesaid such instruments, appliances, and steam launches as may be necessary to make the survey aforesaid; and the Secretary of Commerce and Labor is hereby authorized to have made in the Bureau of the Coast and Geodetic Survey all the plats necessary to show the results of the aforesaid survey and the locations of the said natural oyster beds, bars, and rocks in the waters within the State of Maryland, and to furnish to the board of shellfish commissioners of the State of Maryland such copies as may be necessary, and for this purpose to employ, in the District of Columbia and elsewhere, such technically qualified persons as may be necessary to carry out the purpose of this act.

SEC. 2. That the Secretary of Commerce and Labor is hereby further authorized to have erected or constructed by the officers so detailed as aforesaid, while making such survey, such structures as may be necessary to mark the points of triangulation, so that the same may be used for such future work of the Coast and Geodetic Survey as the said Bureau may be hereafter required to perform in prosecuting the Government coast survey of the navigable waters of the United States located within the State of Maryland.

\* \* \* \* \*

SEC. 4. That this act shall take effect from the date of its passage.

*Survey of Oyster Bars, Wicomico County, Md.*

[Act of Congress approved June 30, 1906.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and seven, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and seven, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including the expenditures authorized under Public Act Numbered One hundred and eighty-one, approved May twenty-sixth, nineteen hundred and six, and contingent expenses incident thereto, five thousand dollars, together with the unexpended balance under this appropriation for nineteen hundred and six and prior years which is hereby reappropriated and made available on this account for the fiscal year nineteen hundred and seven. \* \* \*

[Act of Congress approved March 4, 1907.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and eight, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and eight, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, to be immediately available and to continue available until expended, twenty-five thousand dollars. \* \* \*

[Act of Congress approved May 27, 1908.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and nine, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and nine, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, which expenses, including cost of plats and charts, shall not exceed fifteen thousand dollars in any one year, to be immediately available, twenty thousand dollars.

[Act of the legislature of Maryland approved April 2, 1906.]

AN ACT to establish and promote the industry of oyster culture in Maryland, to define and mark natural oyster beds, bars and rocks lying under the waters of this State, to prescribe penalties for the infringement of the provisions of this Act, and \* \* \*

SECTION 1. *Be it enacted by the General Assembly of Maryland,* That the following sections be, and they are hereby, added to Article 72 of the Code of Public General Laws, title "Oysters." \* \* \*

SEC. 86. The Board of Shell Fish Commissioners shall, as soon as practicable after the passage of this Act, cause to be made a true and accurate survey of the natural oyster beds, bars and rocks of this State, said survey to be made with reference to fixed and permanent objects on the shore, giving courses and distances, to be fully described and set out in a written report of said survey, as hereinafter required. A true and accurate delineation of the same shall be made on copies of published maps and charts of the United States coast and geodetic survey, which said copies shall be filed in the office of the said commissioners in the city of Annapolis; and the said commissioners shall further cause to be

delineated upon copies of the published maps and charts of the United States coast and geodetic survey, of the largest scale, one copy for each of the counties of this State in the waters of which there are natural oyster beds, bars and rocks, all natural beds, bars and rocks lying within the waters of such county, which maps shall be filed in the offices of the clerks of the Circuit Court for the respective counties wherein the grounds so designated may lie.

\* \* \* \* \*

SEC. 87. The Governor of this State is hereby requested to ask the assistance of the United States coast and geodetic survey, and of the United States Fish Commissioner, to aid in the carrying out of the provisions of the preceding section. \* \* \*

SEC. 89. As soon as practicable after the first day of April, 1906, the said commissioners shall organize, and shall at once proceed, with the assistance of such person or persons as may be detailed by the United States coast and geodetic survey, and the United States Fish Commissioner, to aid them in their work, and of such persons as may be appointed under the preceding section, to have laid out, surveyed and designated on the said charts, the natural beds and bars, and shall cause to be marked and defined as accurately as practicable, the limits and boundaries of the natural beds, bars and rocks, as established by said survey, and they shall take true and accurate notes of said survey in writing, and make an accurate report of said survey, setting forth such a description of landmarks as may be necessary to enable the said board, or their successors, to find and ascertain the boundary lines of the said natural oyster beds, bars and rocks, as shown by a delineation on the maps and charts provided in this Act; said report shall be completed and filed in the office of the board in the city of Annapolis within ninety days after the completion of the survey of any county. Said commissioners shall cause the same to be published in pamphlet form, and transmit copies of the same to the clerks of the Circuit Court for the respective counties, where the charts have been filed or directed to be filed as hereinafter provided; the said report to be filed by the clerks of the several counties in a book kept for that purpose. And the said survey and report, when filed, subject to the right of appeal hereafter provided for in this Act, shall be taken in all of the courts of this State as conclusive evidence of the boundaries and limits of all natural oyster beds, bars and rocks, lying within the waters of the county wherein such survey and report are filed, and shall be construed to mean in all of the said courts that there are no natural oyster beds, bars or rocks lying within the waters of the counties wherein such report and survey are filed, other than those embraced in the survey authorized by this Act, and that all areas of the Chesapeake Bay and its tributaries within the State of Maryland, not shown in the survey to be natural oyster beds, bars or rocks, shall be construed in all the courts of the State to be barren bottoms, and open for disposal by the State for the purpose of private planting or propagation of oysters thereon under the provisions of this Act; provided, that the said survey and report shall not be so construed as to affect in any manner the holdings by citizens of this State in any lot which may have been appropriated or taken up under the laws of this State prior to the approval of this Act. \* \* \*

The law of the State of Maryland, passed March 9, 1842, authorizing officers of the United States Coast and Geodetic Survey to enter upon the lands within the State limits for the purposes of the Survey, is as follows:

An Act Concerning the Survey of the Coast of Maryland.

SECTION 1. *Be it enacted by the General Assembly of Maryland,* That it shall and may be lawful for any person or persons employed under and by virtue of an act of the Congress of the United States, \* \* \* at any time hereafter to enter upon lands within this State for the purpose of exploring, surveying, triangulating, or levelling, or doing any other matter or thing which may be necessary to effect the objects of said act, and to erect any works, stations, buildings, or appendages requisite for that purpose, doing no unnecessary injury to private or other property.

SEC. 2.<sup>a</sup> *And be it enacted,* That in case the person or persons employed under the act of Congress aforesaid, can not agree with the owners or possessors of the land so entered upon and used as to the amount of damage done thereto by reason of the removal of fences, cutting of trees or injury to the

<sup>a</sup> Under the rulings of the Comptroller of the Treasury no damages can be collected except through the United States Court of Claims unless an agreement has been made in advance.

crop or crops growing on the same, it shall and may be lawful for the said parties or either of them to apply to the chief justice for the time being or one of the associate judges of the judicial district in which such land may be situated, who shall thereupon appoint three disinterested and judicious freeholders, residents of the same judicial district, to proceed with as much despatch as possible to the examination of the matter in question, and the faithful assessment of the damages sustained by the owners or possessors aforesaid, and the said freeholders or a majority of them, having first taken and subscribed an oath or affirmation before the chief or associate justice aforesaid or other person duly authorized to administer the same, that they will well and truly examine and assess as aforesaid, and having given five days' notice to both parties of the time of their meeting, shall proceed to the spot, and then and there upon their own view and if required, upon the evidence of witnesses, (to be by them sworn or affirmed and examined) shall assess the said damages, and shall afterward make report thereof and of their proceedings in writing under their hands and seals and file the same within five days thereafter in the office of the clerk of the county in which the land aforesaid is situated, subject to an appeal by either party to the county court of the said county within ten days after filing as aforesaid, and the said report so made as aforesaid, if no appeal as aforesaid be taken, shall be held to be final and conclusive as between the said parties, and the amount so assessed and reported shall be paid to the said owners or possessors of the land so damaged within twenty days after the filing of said report, and the said chief or associate justice as aforesaid, shall have authority to tax and allow upon the filing of said report, such costs, fees and expenses to the said freeholders for the performance of their duty as he shall think equitable and just, which allowance shall be paid by the person or persons employed under the act of congress aforesaid, within the time last above limited, but if an appeal as aforesaid be taken, the case shall be set down for hearing at the first term of county court aforesaid, ensuing upon and after appeal, and it shall be lawful for either party immediately after the entry of such appeal, to take out summons for such witnesses as may be necessary to be examined upon the hearing aforesaid, and the said court shall have power in its discretion to award costs against which ever the final judgment shall be entered, and such appeal at the option of either party may and shall be heard before and the damage assessed by a jury of twelve men to be taken from the regular panel and elected as in other cases.

SEC. 3. *And be it enacted*, That if any person or persons shall wilfully injure or deface or remove any signal, monument or building or any appendage thereto, erected, used or constructed under and by virtue of the act of congress aforesaid, such person or persons so offending shall severally forfeit and pay the sum of fifty dollars with costs of suit to be sued for and recovered by any person who shall first prosecute the same before any justice of the peace of the county where the person so offending may reside, and shall also be liable to pay the amount of damages thereby sustained, to be recovered with costs of suit in an action on the case, in the name and for the use of the United States of America, in any court of competent jurisdiction.

#### APPENDIX B.—THE HAMAN OYSTER CULTURE LAW.

[Extract from First Report of Shell Fish Commission.]

##### OBJECT.

"The legislature in placing chapter 711 of the acts of 1906, better known as the Haman Oyster Culture Law, upon the statute books of Maryland had a twofold object in view:

1. To encourage an industry in oyster culture upon the barren bottoms beneath the tidewaters of the State.
2. To prevent the leasing of natural oyster bars for the purpose of oyster culture."

##### SURVEY.

"To make the leasing of barren bottoms possible and the leasing of natural bars impossible, provision was made for a survey of the natural bars for the purpose of accurately locating and marking the same. It was definitely provided that no barren bottoms should be leased in any part of the State until the natural bars of that region had been surveyed, charted, and marked with buoys."

NATURAL BAR NOT DEFINED.

"The Shell Fish Commission is instructed by section 90 of the Haman Oyster Culture Law to exercise its judgment liberally in favor of the natural bars when surveying, charting and buoying them, but other than this the Commission is uninstructed in this important matter. The responsibility of defining a natural bar is placed upon the Commission."

DEFINITION OF A NATURAL OYSTER BAR.

DIVERSITY OF OPINION.

"No definition of a natural oyster bar could be formulated by any man or body of men which would meet with the approval of all parties concerned. Oystermen, as a rule, hold that all bottoms where oysters grow or have grown naturally even though now practically barren of oysters should be considered natural bars. Other citizens of the State who are not directly interested in the oyster business, but interested in the oyster industry from the standpoint of revenue, hold, as a rule, that no bottoms should be excluded from leasing for oyster culture which, by methods known to oyster culturists, may be made to yield a greater number of oysters than they now produce."

"It should be evident to every one that neither of these definitions could be adopted by the Commission as a working basis for determining which of the grounds surveyed are natural oyster bars."

THE GOLDSBOROUGH DEFINITION.

"The definition of a natural bar which very nearly approaches a reasonable and satisfactory compromise between the extreme views given above and which has therefore been adopted by the Commission, is that contained in an opinion rendered by Judge Charles F. Goldsborough in the circuit court for Dorchester County in the July term, 1881, in the case of William T. Windsor and George R. Tood, v. Job T. Moore. It is as follows:

What then is a natural bar or bed of oysters? It would be a palpable absurdity for the State to attempt to promote the propagation and growth of oysters and to encourage its citizens, by a grant of land, to engage in their culture, if the lands authorized to be taken up were only those upon which oysters do not and can not be made to grow. That there may be lands covered by water in the State where no oysters can be found, but where, if planted, they could be cultivated successfully, may be possible, but, if so, I imagine that their extent must be too limited for them to be of much practical, general advantage for the purposes of such a law as the one under discussion; but there are thousands of acres of hard and shifting sands where oysters not only are not found, but where it would be folly to plant them; and these latter it can not be supposed that the State intended to offer to give away, for the simple reason that the State could not help knowing that nobody would have them.

Upon the other hand there are large and numerous tracts where oysters of natural growth may be found in moderate numbers, but not in quantities sufficient to make it profitable to catch them, and yet where oysters may be successfully planted and propagated. In my opinion these can not be called natural bars or beds of oysters, within the meaning of the Act of Assembly, and it is just such lands as these that the State meant to allow to be taken up under the provisions of the above-mentioned section of the Act.

But there is still another class of lands where oysters grow naturally and in large quantities and to which the public are now and have been for many years in the habit of resorting with a view to earning a livelihood by catching this natural growth, and here, I think, is the true test of the whole question. Land can not be said to be a natural oyster bar or bed merely because oysters are scattered here and there upon it, and because if planted they will readily live and thrive there; but whenever the natural growth is so thick and abundant that the public resort to it for a livelihood, it is a natural oyster bar or bed and comes within the above-quoted restriction in the law, and cannot be located or appropriated by any individual."

---

APPENDIX C.—STATISTICS OF RESULTS OF THE COMBINED OPERATIONS OF THE GOVERNMENT AND STATE.

For a further understanding of the character of the oyster survey work that is being carried on in Maryland, the following statistical tabulation of the combined results of the various operations of both the Government and State will be of value. In this connection it should be remembered that

*Survey of Oyster Bars, Wicomico County, Md.*

these statistics only include the new work required to supplement the large amount of existing data obtained from the archives of the Coast and Geodetic Survey and utilized in the preparation of the charts and technical records.

## LETTER OF SUBMITTAL.

---

DEPARTMENT OF COMMERCE AND LABOR,  
COAST AND GEODETIC SURVEY,

*Washington, April 10, 1909.*

SIR: I have the honor to transmit herewith a report of the officer detailed from the Coast and Geodetic Survey to cooperate with the Bureau of Fisheries and the Maryland Shell Fish Commission in surveying the oyster bars of the State of Maryland, and certain technical results which are necessary for the interpretation and use of the plats of the survey made by the Government.

This work has been done under the provisions of the act of Congress entitled "An act to authorize the Secretary of Commerce and Labor to cooperate, through the Bureau of the Coast and Geodetic Survey and the Bureau of Fisheries, with the shell fish commissioners of the State of Maryland in making surveys of the natural oyster beds, bars, and rocks in the waters within the State of Maryland," approved May 26, 1906, and of the acts of Congress making appropriations for sundry civil expenses of the Government for the fiscal years ending June 30, 1907, 1908, and 1909.

Respectfully,

O. H. TITTMANN, *Superintendent.*

TO HON. CHARLES NAGEL,  
*Secretary of Commerce and Labor.*

## CERTIFICATION.

---

ANNAPOLIS, MD., *April 8, 1909.*

The following publication is certified to contain correct technical descriptions of all boundaries and landmarks established in the waters of Worcester County by the Maryland Shell Fish Commission in cooperation with the United States Coast and Geodetic Survey.

C. C. YATES,  
*Chief of Coast and Geodetic Survey Party,*  
*Assistant, Coast and Geodetic Survey.*

---

ANNAPOLIS, MD., *April 8, 1909.*

Examined and certified to be correct.

WALTER J. MITCHELL,  
CASWELL GRAVE,  
BENJAMIN K. GREEN,  
*Maryland Shell Fish Commission.*  
SWEPSON EARLE,  
*Hydrographic Engineer.*

NOTE.—Certified copies of this publication and of the charts of the natural oyster bars of Worcester County were filed in the office of the clerk of the circuit court of Worcester County and in the office of the Board of Shell Fish Commissioners, at Annapolis, on April 12, 1909.

# SURVEY OF OYSTER BARS, WORCESTER COUNTY, MD.

---

## INTRODUCTION.

### PUBLICATIONS.

The preparation of publications relating to the survey of the oyster bars of Maryland has been divided between the Government and the State in accordance with the laws <sup>a</sup> authorizing the work and the natural division of the surveying operations <sup>b</sup> of the cooperating forces.

The publications prepared and issued by the Government under the direction of the Superintendent of the Coast and Geodetic Survey consist of a series of charts and a technical report for each county surveyed.<sup>c</sup> The charts show all legal boundaries of oyster bars within the adopted boundaries of the waters opened up for leasing with each county, and the location of all landmarks (Coast and Geodetic Survey triangulation stations) used as a foundation for the delineation of these various boundaries. The technical report gives technical and legal descriptions of all oyster-bar and other boundaries, and descriptions of all landmarks shown on the charts, and includes the report of the representative of the Coast and Geodetic Survey in charge of the work of that Service in cooperation with the Bureau of Fisheries and the Maryland Shell Fish Commission. These charts and technical reports are prepared and certified for file with the courts and the Commission, as required by the laws of the State, and contain all information necessary to make a permanent record of the work of the Commission and the Government for all future requirements of the courts, or for any resurveys that may become necessary.<sup>d</sup>

The publications prepared and issued by the State under the direction of the Shell Fish Commission consist of annual reports<sup>e</sup> of all the operations of the Commission

---

<sup>a</sup> See Appendix A for laws relating to the cooperation of the Coast and Geodetic Survey and Bureau of Fisheries with the Maryland Shell Fish Commission.

<sup>b</sup> See Appendix C for a summary of the particular surveying operations which constitute an "oyster survey" as now being carried on in Maryland.

<sup>c</sup> These charts and technical reports can be obtained by application to the Superintendent of the Coast and Geodetic Survey, at Washington, D. C. The publications ready for issue are those for Anne Arundel, Somerset, Wicomico, and Worcester counties; those for Calvert, St. Marys, and Charles counties are now being prepared.

<sup>d</sup> The technical records and charts for each county are published separately on account of the requirements of the oyster-culture laws of the State and the practical considerations which make it desirable to have each county "opened up" for oyster culture as soon as practicable after the completion of its survey. For these reasons and the fact that these reports are each arranged for distribution and use in one county only without reference to other published records, much of the text of this publication is of necessity identical with similar previous publications for other counties.

<sup>e</sup> These reports can be obtained by application to the Shell Fish Commission, Annapolis, Md. They are issued annually in October, and the first and second reports are now available for distribution.

performed under the provisions of the laws of Maryland,<sup>a</sup> including results of biological and economic oyster investigations, methods and results of the hydrographic survey of the boundaries of oyster bars and crab bottoms, the administrative report and financial statement of the Commission, information relating to oyster culture, methods of surveying and leasing of oyster lots, and much other important matter of legal and scientific value.

These two sets of publications are planned and arranged to supplement each other without unnecessary duplication, and when combined they form a complete report of operations, methods, and results of the work of both the Government and State.<sup>b</sup>

#### COOPERATION OF THE COAST AND GEODETIC SURVEY.

The work of the Coast and Geodetic Survey, as the name of the Service indicates, includes a survey of the coasts of the United States made on a geodetic basis. This has involved the gradual construction of a great framework of interstate triangulation for use as a foundation for detail hydrographic and topographic surveys, from which there has been compiled and published a complete set of charts of the coasts of the United States, including all waters of Maryland where oysters grow. This existing triangulation, hydrography, and topography is essential as a foundation for a correct and practical survey of natural oyster bars; and it being one of the fundamental functions of the Coast and Geodetic Survey to furnish such data, the cooperation of the Coast and Geodetic Survey with the Bureau of Fisheries and the Maryland Shell Fish Commission is a practical and natural development of Government work leading to the conservation and increase of the supply of food.

#### COOPERATION OF THE BUREAU OF FISHERIES.

The Bureau of Fisheries has cooperated with the Coast and Geodetic Survey and the Maryland Shell Fish Commission principally as an adviser in matters relating to the biological and economic survey of oyster bars and the methods to be employed for that purpose.<sup>c</sup> A steam launch, rowing boat, and certain apparatus have also been furnished.

The primary function of the Bureau of Fisheries is to increase the productiveness of marine and fresh waters by such measures as may be best suited to the purpose, and the services rendered in connection with the survey of the oyster bars of Maryland are strictly in line with the fundamental law under which it acts. In certain States other than Maryland similar work has been conducted by the Bureau acting independently, the same ends being attained at greater expense to the Government.

#### GENERAL STATEMENT OF WORK OF COAST AND GEODETIC SURVEY.<sup>d</sup>

The results obtained from the work of the Coast and Geodetic Survey in cooperation with the Bureau of Fisheries and the Maryland Shell Fish Commission need very

<sup>a</sup> See Appendix B for an extract from the "Second Report of the Maryland Shell Fish Commission," giving a concise summary of the "Haman Oyster Culture Law."

<sup>b</sup> See Appendix D of this publication for "Statistics of results of combined operations of the Government and State."

<sup>c</sup> Hon. George M. Bowers, Commissioner of Fisheries, has detailed for this service Dr. H. F. Moore, Assistant, Bureau of Fisheries.

<sup>d</sup> For a detail statement of the very large amount of excellent oyster survey work of the Maryland Shell Fish Commission see the "Annual Reports of the Maryland Shell Fish Commission."

little other summary than is indicated by the published "Charts of Natural Oyster Bars" and the scheme of hydrographic projections and triangulation stations shown on the county progress maps attached to each report.

The triangulation has been carried on in accordance with the standard methods of the Coast and Geodetic Survey, making this work and that of the "Descriptions of Triangulation Stations" of permanent value, not only to the State of Maryland in the survey of her oyster bars, but also to the Government for any future work it may do in the regions covered by the oyster-survey operations.

The hydrographic projections and published charts are prepared with all the accuracy permitted by their large scale, especially as to the boundaries of the various shellfish bottoms in relation to landmarks, but this accuracy of location on the charts is further added to and permanently fixed by published technical descriptions which should minimize the probability of any future dispute as to either landmarks or boundaries.

Stated another way and quoting from the report of the "Survey of Oyster Bars of Anne Arundel County:"

The geographic positions of the permanent landmarks and signals have been determined with the usual precision of a trigonometric survey, and their locations at all points necessary to provide ample foundation for the surveying and charting operations permitted great accuracy of definition and location for the natural oyster bar and other boundaries established. At the same time, the very important element of permanency of the positions of boundaries has been secured, as the relocation of geodetic positions can always be accomplished by a competent surveyor, even though the original landmarks and monuments have been washed away, as has been the fate of hundreds of such points established by the Coast and Geodetic Survey on the shores of the Chesapeake Bay during the last sixty-five years.

In fact, when the survey of the oyster bars of Maryland is completed, it is believed that it will stand the test of time and practical use as a working foundation for whatever form the oyster legislation of the future may assume, and that the doing of the work systematically and accurately, once for all, means the establishment of a foundation of a great oyster industry by ineradicably locating the natural oyster bars for the use of the public, and a still greater permanent superstructure of real oyster culture as a reward for individual enterprise, by reason of the integrity of the survey by which the rights of the public are secured.

REPORT OF THE WORK OF THE COAST AND GEODETIC SURVEY IN  
WORCESTER COUNTY.

INSTRUCTIONS.

The following two letters, together with the laws<sup>a</sup> of the United States relating to the subject, constitute the "instructions" received by the chief of the Coast and Geodetic Survey party engaged on work in connection with the Maryland Shell Fish Commission. They are short and definite, but furnish ample authority and leeway for all legitimate development of the cooperation of the Government and the State in the survey of oyster bars. The "free hand" permitted by these orders, together with the aid and many valuable suggestions received from the officers of the Survey at Washington, have proved very beneficial to the work, and are greatly appreciated.

DEPARTMENT OF COMMERCE AND LABOR,  
OFFICE OF THE SECRETARY,  
*Washington, June 2, 1906.*

SIR: In reply to your letter of May 28, requesting me to designate officers of the Coast and Geodetic Survey and of the Bureau of Fisheries to cooperate with the State of Maryland in making survey of and locating the natural oyster beds, I have the honor to inform you that Mr. C. C. Yates will be designated to cooperate on the part of the Coast and Geodetic Survey as soon as Congress makes the provisions of the act effective by providing an appropriation for the purpose.

Respectfully,

LAWRENCE O. MURRAY, *Assistant Secretary.*

His Excellency HON. EDWIN WARFIELD,  
*Governor of Maryland, Annapolis, Md.*

DEPARTMENT OF COMMERCE AND LABOR,  
COAST AND GEODETIC SURVEY,  
*Washington, July 3, 1906.*

SIR: Upon the receipt of these instructions you will surrender the command, accounts, etc., of the steamer *Endeavor* to the Hydrographic Inspector. \* \* \*

As soon as this transfer is completed you will enter upon the duties of Coast Survey representative on the Shell Fish Commission of Maryland.

You will consult the commissioners, prepare a programme of work, and submit estimates in the usual form.

You are authorized to come to Washington for consultation from time to time as may be necessary.

\* \* \* \* \*

Very respectfully,

O. H. TITTMANN, *Superintendent.*

Capt. C. C. YATES,  
*U. S. C. and G. S. Steamer Endeavor, Baltimore, Md.*

<sup>a</sup> For these laws see Appendix A.

## ORGANIZATION AND EQUIPMENT.

The personnel and occupation of the party of the Coast and Geodetic Survey have remained practically unchanged since the beginning of the "oyster survey." Besides the chief of party, it consists of the necessary triangulators, computers, draftsmen, and temporary employees required to carry on both the surveying operations in the field and the preparation for publication of oyster charts and technical records in the Office at Washington.

The transportation equipment for the field work of the party in Worcester County was confined to hired launches and boats, as the waters of that region are too shallow for the use of the type of boats utilized by the Survey and the Commission in Chesapeake Bay.

It being impracticable to move the Shell Fish Commission house boat *Oyster* to the ocean coast of Maryland, the convenient living and office quarters furnished the Government on that vessel had to be exchanged for temporary quarters on shore.

The greater part of the equipment of instruments for the operations of both the Government and State has been furnished by the Coast and Geodetic Survey, and consists of all necessary theodolites, levels, sextants, drafting instruments, hydrometers, etc., required for all field and office work.

## CHRONOLOGICAL STATEMENT OF WORK.

The field work in Worcester County dates from November 8, 1907, when the survey in Wicomico County was completed and the entire party moved to Chincoteague, Va., where headquarters were established.

On December 6, 1907, a subparty was organized for field work in the upper part of the county, the work of this party being done from a small house boat which was towed by a gasoline launch.

On December 19, 1907, all field work was closed for the season and office quarters established in Baltimore.<sup>a</sup>

No further field work was done in Worcester County until March 23, 1908, when a subparty was organized to complete the triangulation, which work was finished on April 18, 1908.

On March 8, 1909, a subparty was organized to do some additional field work in Somerset County, and at the same time to inspect and replace certain triangulation monuments in Worcester County which were reported to have been injured. This latter work occupied thirteen days and was completed March 30, 1909.

The office work connected with Worcester County, including the preparation of the oyster charts and technical records for publication, has been continued intermittently from the beginning of the field work, on November 8, 1907, to the present time. The delay in the completion of the office work was due to various causes, but chiefly to the desirability of utilizing the new shore line being surveyed for other purposes by a topographic party of the Coast and Geodetic Survey. This topographic work was available for use in the preparation of publications in beginning of present year, and adds greatly to the accuracy and value of the published oyster charts of Worcester County.

<sup>a</sup> Office rooms were furnished for the work of the Coast and Geodetic Survey in the new custom-house by courtesy of Hon. William F. Stone, collector of customs.

STATISTICS.<sup>a</sup>

Landmarks and triangulation signals erected.....	36
Monuments planted to mark triangulation stations.....	34
Triangulation stations occupied for observations of horizontal angles.....	38

Back azimuths and distances computed from corners of boundaries to triangulation stations.....	324
Descriptions of triangulation stations prepared for publication.....	48
Descriptions of oyster boundaries prepared for publication.....	28
"Charts of Natural Oyster Bars" prepared for publication.....	3
Progress map prepared for publication.....	1

## GENERAL REMARKS.

Before ending this report the representative of the Coast and Geodetic Survey wishes to renew his statement of appreciation of the courteous assistance received from various Government and State officials and others interested in the oyster industry of Maryland, especially to the following:

To his colleague from the Department of Commerce and Labor, Dr. H. F. Moore of the Bureau of Fisheries, whose well-known scientific knowledge of all matters relating to oysters has been of great value to the work.

To Mr. Walter J. Mitchell, chairman of the Maryland Shell Fish Commission, who, by his administrative ability in carrying out the complicated requirements of the oyster laws and by his unflinching tact, has made the cooperation of the various services engaged on the work both agreeable and effective.

To Dr. Caswell Grave, secretary of the Commission, who, as editor of the Commission's annual report and Commissioner in charge of the biological and economic oyster investigations, has been brought into constant contact with the Government work and aided its operations in every way.

To Benjamin K. Green, treasurer of the Commission, who has looked after the equipment and commissary of the house boat in such a way as to add greatly to the comfort and convenience of the party of the Coast and Geodetic Survey.

To Swepson Earle, hydrographic engineer to the Commission, whose knowledge of the work from former service in the Coast and Geodetic Survey has greatly facilitated his practical use of the technical data furnished by the Government.

To Thomas H. Robinson, counsel to the Commission, for courteously furnishing valuable information relating to county boundaries.

And to the many others connected with the Commission or who as residents in the locality where the work was being carried on have greatly assisted by furnishing important information or willing services.

<sup>a</sup> These statistics only include field and office work directly performed by the party of the Coast and Geodetic Survey in connection with the oyster survey of Worcester County, and do not include the many thousands of soundings and examinations of the character of the bottom made by the engineers of the Commission, which are of considerable value to the Coast and Geodetic Survey as hydrographic records for future use in connection with the preparation of new editions of charts of the waters of Maryland.

## CHARTS AND MAPS.

### CHARTS OF NATURAL OYSTER BARS.

The charts<sup>a</sup> of the natural oyster bars of Worcester County, published by the Coast and Geodetic Survey from results of surveys of the Government in cooperation with the Maryland Shell Fish Commission, consist of three sheets covering the greater part of the shores of Chincoteague and Sinepuxent bays, including all oyster-producing bottoms of Worcester County. They are published on a scale of 1 part in 20,000 (approximately  $3\frac{1}{6}$  inches to a statute mile) and are constructed on polyconic projections which are based on the United States standard datum of the Coast and Geodetic Survey.

These charts show all oyster bars and other boundaries established by the Commission, and are certified for the purpose of filing in the office of the clerk of the circuit court of Worcester County and in the office of the Commission at Annapolis, as required by the oyster laws of Maryland.

In addition to the oyster-bar and other boundaries, the charts show the location and name of all landmarks (U. S. Coast and Geodetic Survey triangulation stations) used in making the survey, together with the hydrography and topography<sup>b</sup> necessary to make the technical definitions and delineations of boundaries readily understandable both by the people engaged in the oyster industry and the general public who may become interested through leasing of barren bottoms for oyster culture.

The names of the oyster bars are those used locally, as nearly as could be ascertained by the hydrographic engineer of the Commission. When there was no local name in common use, a name was selected from one of the prominent features of the vicinity. By the use of recognized names or those that would naturally suggest certain sections of water, it is believed that much confusion will be avoided in the location on the charts of the oyster bars, especially by those not familiar with the use of maps.

The corners of the oyster bars are numbered from 1 to the total number of corners in each area under consideration. Where boundaries adjoin, making one point a corner of two or more oyster bars, these points have two or more numbers, each number corresponding to the bar in which the figure is located. The numbers of the corners correspond with the technical and legal descriptions of this publication under the heading "Boundaries of natural oyster bars."

The landmarks and oyster bars have been grouped in the "Contents" of this publication in accordance with the charts upon which they are shown. To find a

<sup>a</sup> These charts can be obtained by application to the Superintendent of the Coast and Geodetic Survey, at Washington, D. C.

<sup>b</sup> Much of the detail of the inshore topography was obtained from the excellent map of Worcester County prepared and published by the Maryland Geological Survey under the direction of Dr. William Bullock Clark from surveys of the Maryland Geological Survey in cooperation with the U. S. Geological Survey.

particular oyster bar or landmark which is only known by name, consult the "Contents" and the desired chart and general location will be indicated. To find the name of a bar or landmark which is only known by location, consult the progress map at the end of this publication for the number of the chart on which it is to be found, and then examine the known locality on the chart for the name of the bar or landmark in question.

The contours on the charts showing the depth of water at mean low tide have been taken from the hydrographic sheets of former work of the Coast and Geodetic Survey.

The boundaries of the waters within the "territorial limits of the county" opened up for the leasing with Worcester County are plainly indicated on the charts. A description of this boundary is given in this publication under the heading "Boundaries of the county waters."

The areas in acres of the oyster bars were determined under the direction of the hydrographic engineer of the Commission by two independent planimeter measurements of the areas as delineated on the smooth projections of the Coast and Geodetic Survey. These areas are given in small figures in parentheses on the face of the chart within the boundaries of the different shellfish bottoms.

The symbols used on the charts for the different kinds of boundaries, triangulation stations, contours of depth of water, etc., require no other explanation than that given in the legend and other notes on the face of the charts.

#### LEASING CHARTS.

The leasing charts of Worcester County, like those for Anne Arundel, Somerset, and Wicomico counties, have been prepared under the direction of the hydrographic engineer of the Commission. These charts are constructed on polyconic projections which are based on the United States standard datum of the Coast and Geodetic Survey. They are made on the scales of 1 part in 5,000 or 1 part in 10,000, as the needs of oyster culture may require. Anne Arundel County required 13 leasing charts, Somerset County 12, Wicomico County 2, and Worcester County 3 to cover their oyster bottoms.

These charts show all the oyster bars, crab bottoms, and clam beds and other boundaries established by the Commission, and also all boundaries of oyster lots leased for the purpose of oyster culture, thus making them comprehensive and valuable records of the results of the operations of the oyster-culture laws.

The lots leased under the provision of the "old 5-acre law" are frequently of irregular shape, but the lots leased under the provision of the new oyster laws must be of rectangular shape by the terms of that act. For this latter purpose the leasing charts have been divided by parallels of latitude and meridians of longitude into small rectangles of 1 acre or 5 acres, as may be best suited to the area under consideration, and prospective leaseholders by the rules of the Commission are compelled to select whole rectangles as far as practicable.

For reasons of the present changeable nature of the number of lots leased and the large number of charts required, the leasing charts are not likely to be published for some years, but they can be seen at any time on file at the offices of the Commission, in Annapolis.

PROJECTIONS.

The polyconic projections <sup>a</sup> covering Worcester County waters are 5 in number and on the scale of 1 part in 10,000. They were constructed by draftsmen of the Coast and Geodetic Survey, who also plotted the sextant positions which determine the location of the legal boundaries of the oyster bars as delineated by the Shell Fish Commission.

A copy of each of these projections, with all the plotted positions of triangulation stations, shore line, sextant positions, and boundaries of oyster bars, was made under the direction of the hydrographic engineer of the Commission by pricking through with a sharp needle the intersections of the projection lines and all other points as plotted on the original sheets.

These projections (in duplicate) are the original records of all oyster-bar and other boundaries established by the Commission, one set being filed in the archives of the Coast and Geodetic Survey, at Washington, and the other set in the office of the Shell Fish Commission, at Annapolis.

PROGRESS MAPS.

The progress map to be found at the end of this publication is on a scale of 1 part in 100,000, and shows in outline the work accomplished by the U. S. Coast and Geodetic Survey in Worcester County and contiguous waters. It gives the scheme of all the charts and smooth projections constructed in connection with the survey, the location and names of all triangulation stations used as a basis for the surveying work, and the "boundaries of county waters" established by the Commission for the purpose of carrying out the laws of Maryland relating to oyster culture.

Besides indicating the amount of work done by the Coast and Geodetic Survey in connection with the work of the Shell Fish Commission, this progress map will be of special value for index purposes to engineers and others searching for the particular chart or projection covering the locality of the oyster bars or landmarks that may be under consideration.

The progress maps <sup>b</sup> accompanying the first and second annual reports of the Maryland Shell Fish Commission were prepared under the direction of the hydrographic engineer of the Commission. They are on the scale of 1 part in 400,000, and show the outline of the tide-water counties of Maryland, with shaded areas to indicate the waters already covered by the operations of the oyster survey.

---

<sup>a</sup> For the scheme of these projections see the progress map at the end of this publication.

<sup>b</sup> These maps and reports can be obtained by application to Maryland Shell Fish Commission, Annapolis, Md.

## BOUNDARIES OF THE COUNTY WATERS.<sup>a</sup>

### WATERS WITHIN TERRITORIAL LIMITS OF COUNTY.

The laws of Maryland relating to oyster culture provide that "no person shall be permitted, by lease, assignment, or in any other manner, to acquire a greater amount of land than ten acres situated within the territorial limits of any of the counties, or one hundred acres in any other place."

The boundary line<sup>b</sup> between the waters "within the territorial limits" of Worcester County and the waters in "any other place," as established by the Shell Fish Commission for the purpose of carrying out the oyster laws, and delineated on the charts and the smooth projections of the Coast and Geodetic Survey, is identical with the boundary line between the waters of Worcester County and the waters of the adjacent States of Delaware and Virginia excepting the waters of the Atlantic Ocean. Therefore technically all waters opened up for leasing with Worcester County are within the "territorial limits" of that county.

### WATERS CONTIGUOUS TO COUNTY.

The oyster laws of Maryland provide that a true and accurate delineation of all natural oyster bars shall be made on copies of charts of the U. S. Coast and Geodetic Survey, "which said copies shall be filed in the office of the said Commissioners in the city of Annapolis," and "in the office of the clerks of the circuit courts for the respective counties wherein the grounds so designated may lie."

For the purpose of carrying out the latter part of this section of the law and for the purpose of establishing the limits of the oyster-culture area to be opened up for leasing with each county surveyed, it is necessary for the Shell Fish Commission to establish a boundary line between the waters contiguous to but not within the territorial limits of each county, and the waters contiguous to but not within the territorial limits of adjacent counties. But technically, as explained under the preceding heading of "Waters within territorial limits of county," there are no "waters contiguous to the county" in Worcester County excepting the waters of the ocean, and therefore there are no waters opened up for leasing with that county in which a person can lease "a greater amount than ten acres."

<sup>a</sup> For a complete historical and legal description of the boundaries of the counties of Maryland, the valuable publication entitled "The Counties of Maryland—Their Origin, Boundaries, and Election Districts," prepared by Dr. Edward B. Mathews and published by the Maryland Geological Survey under the direction of Dr. William Bullock Clark, Superintendent, should be consulted, as the boundaries described in this publication have been established and technically defined for the purpose of carrying out the oyster laws of the State, and may or may not be correct for other purposes.

<sup>b</sup> See "Charts of Natural Oyster Bars," published by the Coast and Geodetic Survey, and the progress map at the end of this publication.

## LANDMARKS (U. S. COAST AND GEODETIC SURVEY TRIANGULATION STATIONS).

### EXPLANATION.

The oyster laws of Maryland authorizing the survey to be made by the Shell Fish Commission provide for "an accurate report of said survey, setting forth such a description of landmarks as may be necessary to enable the said board, or their successors, to find and ascertain the boundary lines of said natural oyster beds, bars, and rocks, as shown by delineation on the maps and charts." The law of the United States authorizing the cooperation of the Department of Commerce and Labor in the survey of natural oyster bars of Maryland provides for the erection of "such structures as may be necessary to mark the points of triangulation, so that the same may be used for such future work of the Coast and Geodetic Survey as the said Bureau may be hereafter required to perform in prosecuting the Government coast survey of the navigable waters of the United States located within the State of Maryland."

Under the provisions of the sections of the laws stated above, the markings and descriptions of landmarks must be sufficient for the present and future needs of both the Government and the State. With this end in view, considerable work has been expended in erecting permanent monuments at the triangulation stations and in the proper description of their location.

An effort has been made to arrange the descriptions of location and character of landmarks in a uniform and logical manner. The descriptions start with the assumption that the individual seeking a landmark has only an indefinite idea of its location. They gradually proceed from description of the general locality of a landmark to the descriptions of its immediate surroundings. This is followed by specific details of the character of the center and reference marks and a "round" of reference angles and distances which in themselves frequently contain enough information to furnish an independent and reliable location of the triangulation station.

### METHOD OF DESCRIBING TRIANGULATION STATIONS.

*The separate descriptions of triangulation stations should not be used without reading the following explanation of the method of describing the triangulation stations, as it contains certain details that are common to all the landmarks described in this publication and which are omitted in the separate descriptions as being needless repetitions.*

*Name.*—The title at the top of each separate description is the name by which the landmark or triangulation station is known and designated in all work and published oyster records or oyster charts of both the Government and State. The selection of the name is usually left to the triangulator establishing the station, and it may or may not have geographic or other significance in reference to the locality.

*General locality.*—Under this heading is given the general locality of the landmark in reference to well-known and prominent natural or artificial features, such as the nearest body of water, town, river, steamer wharf, well-defined point of land, church, or any other feature that is likely to remain both permanent and prominent.

This heading also covers a reference to the published chart or map which shows the location of the station most clearly. Nearly all the triangulation stations described in this publication are plainly indicated by name and a triangulation symbol on the published charts of oyster bars of Maryland. In this case they are referred to by serial number only, the words "charts of oyster bars of Maryland" being omitted to avoid needless repetition. These published oyster charts are on the large scale of 1 part in 20,000 (approximately  $3\frac{1}{2}$  inches to a statute mile) and show the location of the triangulation stations so clearly that in many cases the written descriptions will not be required to find them.

*Immediate locality.*—Under this heading is given the description of the "observed station" in reference to its immediate surroundings. This is supposed to include a statement of the station's estimated elevation above high water or some other well-defined level of the locality, such as a road or house; the character of the ground on which it is located, such as marsh land, sand beach, cultivated field, or meadow; estimated bearings in points of the compass and estimated distances in yards *from* (not *to*) easily recognized features, such as extreme end of point, edge of bluff, bank of creek, line of telephone poles, shore line, barn, house, fence, ditch, trees, or any other definite detail, such as being on range with the tangent of an island and a church; and so forth.

When a standard monument has been established near the station as a "reference station," this heading also covers a statement of the true bearing of the monument in degrees and minutes and its measured distance in meters, as it is the first object that is likely to catch the eye when the immediate vicinity of the desired station is reached and might be mistaken for the center mark of the "observed station" unless special attention is called to it.

The distinction between the "observed station" and "reference station" should be carefully noted by anyone making use of the description of stations for any future surveying operations.

The "observed station" is located at the particular triangulation point covered by the description of stations, and is the one whose geographic position is first computed, as it is the point which was "occupied" and "observed on" for horizontal angles. However, in spite of the primary importance of the location of the "observed station," it will be noted from the description of stations that frequently it is not marked as well as the "reference station," and in many instances has only a pine stub to indicate its position. This is the case for the reason that the necessity of intervisibility of landmarks usually made it compulsory to locate "observed stations" on edges of banks and ends of points of land, which in the tide-water section of Maryland generally means they will be washed away in a short period of years. The past experience of the Coast and Geodetic Survey in this region has shown the great need of "reference stations," if the frequent reestablishment of a new framework of triangulation is to be avoided.

The chief reason and need for the establishment of the "reference station," or secondary station, as it might be well named, is explained in the preceding paragraph, but in several instances other reasons, such as the location of the "observed station"

on an unstable sand dune, in a cultivated field, in front of a residence, or other places objectionable to the landowner, have led to establishment of "reference stations." The location of the "reference station" in relation to the "observed station" is fixed for plotting on charts or for computation of its geographic position by checked measurements of its distances and azimuth from the "observed station."<sup>a</sup>

*Marks.*—Under this heading is given a description of the character of the permanent monuments or other marks of the location of the "observed station," and of the "reference station" where one has been established.

All the marks designated in the descriptions as "the center point of triangle on standard cement monument" are exactly alike. These monuments are made of cement, sand, and gravel, and are 2 feet long and 8 inches square at top and bottom. Their tops are all marked with the same brass mold and show a center hole surrounded by a triangle, with the letters "M. S. F. C." arranged around the vertex and the letters "U. S. C. S." underneath the base of the triangle. The center hole is always in the center of the top of the monument by construction, and if this is found to have been broken off without disturbing the bottom the center of its square section can be used as the location of the station.

All the "standard cement monuments," whether used for marking the "observed station" or "reference station," have been planted upright in exactly the same manner, with their tops projecting 3 or 4 inches above the surface of the ground, unless otherwise stated.

Therefore, as the above facts in reference to the "standard cement monuments" are a constant element in all cases, the repetition of these facts in the description of stations is made needless by this one statement.

*References.*—Under this heading are given the "rounds" of directions and distances to all objects that might be useful in locating the stations when the surface marks can not be found. It is also contemplated that for general purposes of topography, hydrography, or location of boundaries of oyster bars these references will be sufficient in many cases to relocate the position of an "observed station" or "reference station" when both of them have been destroyed.

The first reference object given in the descriptions is always a triangulation station visible from the station being described, this, if possible, being a light-house, church spire, or other permanent and prominent point. Its direction is taken as being  $0^{\circ} 00' 00''$ , and the directions of all other objects are measured from it as an initial point, the angles being taken in a clockwise direction (left to right).

The true bearing<sup>b</sup> of the initial object is always given in parentheses alongside its name. This furnishes means for the calculation of the bearings of any of the other reference objects for the purposes of locating a station by horizontal angles or for the relocation of corner buoys of oyster-bar boundaries by the method of compass directions described in this publication under the heading of "Boundaries of oyster bars."

<sup>a</sup> Geographic coordinates (latitude, longitude, distance, and azimuth) relating to any of the "observed stations" or of the "reference stations" described in this publication can be obtained by application to the Superintendent of the Coast and Geodetic Survey, at Washington, D. C.

<sup>b</sup> The mean magnetic variation for Worcester County was  $5^{\circ} 55'$  west of north in 1909 and increasing at the rate of  $3\frac{1}{2}'$  yearly.

The distances in the last column under "References" are given in three different units, which vary according to their accuracy. The "miles" are statute miles and may be considered only as rough estimates. The "yards" are more accurate, but must be looked on as results generally obtained by pacing or careful estimating. The "meters," however, are accurate to the degree indicated by their decimals and in every case have been measured with a steel tape. In the same manner the accuracy of the directions are indicated by the refinement of angular measure with which they are recorded.

## DESCRIPTIONS OF TRIANGULATION STATIONS.

## THOROFARE.

*General locality.*—Western shore of Sinepuxent Bay and southern shore of Isle of Wight Bay on land known as Drum Point. (See progress map.)

*Immediate locality.*—Observed station is on "Thorofare Farm," about 400 yards from Sinepuxent Bay and 165 yards southwest from the Thorofare. It is in a cultivated field about 8 feet above high-water mark on the second knoll southwest from the Thorofare, 400 yards north of "Thorofare Farm" house, 200 yards west of a wagon trail, and 32 yards southwest of the lowest point of the hollow between the two knolls.

*Marks.*—Observed station is center point of triangle on standard cement monument buried with top 12 inches below surface of ground. Cement monument marking reference station is in bottom of hollow between the two knolls 51.032 meters N 65° 21' E of observed station and about on range with Isle of Wight Life-Saving Station.

## COLLIER.

*General locality.*—Eastern shore of Sinepuxent Bay about one-half way between bay and ocean, ¼ mile north-northeast of "Convent Water Tower" and ½ mile south of Collier Islands. (See progress map.)

*Immediate locality.*—Observed station is on sand and grass beach land about 3 feet above high water, about 65 yards west of top of sand dunes, 8 yards north of a high-water overflow, and 42 yards west of line of telephone poles.

*Marks.*—Observed station is center point of triangle on standard cement monument buried with top 4 inches below surface of sand.

## CONVENT WATER TOWER.

*General locality.*—Between Sinepuxent Bay and Atlantic Ocean, about 1 mile north-northeast of "Ocean City Water Tower." (See progress map.)

*Immediate locality.*—Observed station is on a large wooden water-tower structure belonging to the Convent of Saint Rose, at Ocean City. This tower is detached from the main building and is a very prominent object.

*Marks.*—Observed station is center point of top part of water-tank structure.

*References.*—None necessary.

## GANTT.

*General locality.*—Western shore of Sinepuxent Bay, opposite Ocean City and about ½ mile back from the water. (See progress map.)

*Immediate locality.*—Observed station is in cultivated field on Gantt (formerly Davis) farm, and is about 10 feet above high water. It is about 300 yards north by west of the old Davis farmhouse, on a ridge or slight rise of ground making out from woods, 260 yards east-southeast of old woods and 90 yards east of a young growth of pines adjacent to old woods. It is also about 70 yards north of east-and-west wire fence and ditch and 83 yards west of a north-and-south fence and road running to farmhouse. Cement monument marking reference station is 85.44 meters S 89° 48' W of station in the edge of young growth of pines.

*Marks.*—Observed station is center point of triangle on standard cement monument buried with top 2 feet below the surface of the ground. Reference station is center point of triangle on standard cement monument with top about 4 inches above the ground.

## HAMILTON.

*General locality.*—Eastern shore of Sinepuxent Bay, in Ocean City, about  $\frac{1}{2}$  mile northeast of the railway bridge and two-thirds the way from Sinepuxent Bay to the board walk on the ocean side. (See progress map.)

*Immediate locality.*—Observed station is on sand and grass land about 6 yards east-southeast of the extension of the east curb line of Philadelphia avenue, 145 yards northwest of Episcopal Church spire, 16 yards east-southeast of the telephone line edge of wagon trail along proposed Philadelphia avenue, and 40 yards north of an exposed line of sewer pipe.

*Marks.*—Observed station is center point of triangle on standard cement monument.

## OCEAN CITY WATER TOWER.

*General locality.*—Between Atlantic Ocean and Sinepuxent Bay, in Ocean City, Md. (See Chart No. 13.)

*Immediate locality.*—Observed station is located about 80 yards north by east of Ocean City railroad station, 30 yards south by west from curb of Talbot street, and 60 yards west by north from curb of Baltimore avenue. It is on a steel structure 100 feet high, supporting a large round water tank 25 feet deep, which is known as "Ocean City Water Tower."

*Marks.*—Observed station is center point of upper end of standpipe.

*References.*—None necessary.

## HARMON.

*General locality.*—West shore of Sinepuxent Bay, about  $\frac{3}{4}$  mile back from west end of railroad bridge and just south of the B. C. & A. railway tracks. (See Chart No. 13.)

*Immediate locality.*—Observed station is about 170 yards east of the first pine woods from the bay shore and about 145 yards east of some young growth pines adjacent to the woods. It is in a field about 72 yards south of the east and west railway tracks and about 65 yards south of the railway fence.

*Marks.*—Observed station is center point of triangle on standard cement monument buried with top about 12 inches below the surface of the ground.

*References.*—

3 or 4 small trees-----	126	--	--	½ mile.
Left clump of trees-----	157	--	--	½ mile.

## OCEAN.

*General locality.*—Eastern shore of Sinepuxent Bay, about one-third way from bay to ocean and about ⅓ mile south-southwest of "Ocean City Water Tower." (See Chart No. 13.)

*Immediate locality.*—Observed station is on sand and grass land about 8 yards east of telephone line and about 2 yards west of an old line of poles formerly used to support wires. It is apparently in proposed extension of Philadelphia avenue, but this is uncertain, as the street lines are indefinite in this locality.

*Marks.*—Observed station is center point of triangle on standard cement monument buried with top 12 inches below surface of sand.

## BUFFING.

*General locality.*—Western shore of Sinepuxent Bay, on lowland about 200 yards northeast of knoll known locally as "Steam Mill Hill" and about 1½ miles southwest of Ocean City. (See Chart No. 13.)

*Immediate locality.*—Observed station is on sand and loam land about 2 feet above high water, 25 yards west from shore, 65 yards northwest of where wire fence meets shore, 30 yards northeast of nearest point of fence, and 60 yards from junction of fence and pine woods.

*Marks.*—Observed station is center point of triangle on standard cement monument.

## BUFFINGTON WINDMILL.

*General locality.*—Western shore of Sinepuxent Bay, on knoll known locally as "Steam Mill Hill" and about 1½ miles southwest of Ocean City. (See Chart No. 13.)

*Immediate locality.*—Near house belonging to Mr. Buffington.

*Marks.*—Observed station is center of windmill tower.

*References.*—None necessary.

## GULL.

*General locality.*—Eastern shore of Sinepuxent Bay nearly halfway between bay and ocean and about 1 mile south-southwest of Ocean City. (See Chart No. 13.)

*Immediate locality.*—Observed station is on sand and grass beach land about 2 feet above high water, 130 yards west of Life-Saving Service telephone line, 200 yards west of top of sand dunes and 65 yards south of a square marble pillar projecting above ground in middle of a bare washed space. Cement monument marking reference station is 7.68 meters S 88° 58' W of observed station and about on line with left end of woods below Buffington farmhouse.

*Marks.*—Observed station is nail in stub flush with sand and grass. Reference station is center point of triangle on standard cement monument.

## INKQUILL.

*General locality.*—Western shore of Sinepuxent Bay, near Coffins Point, about 2¾ miles southwest of Ocean City. (See Chart No. 13.)

*Immediate locality.*—Observed station is on top of a shell knoll about 10 feet above high-water mark, 30 yards west of shore, 100 yards from corner of fence near Kelley house, 150 yards from near corner of Kelley house, and about 55 yards southeast of a ditch. \*

*Marks.*—Observed station is center point of triangle on standard cement monument buried with top 12 inches below surface of ground.

## SEASIDE.

*General locality.*—Eastern shore of Sinepuxent Bay, about halfway between bay and ocean and about 2¼ miles south-southwest of Ocean City. (See Chart No. 13.)

*Immediate locality.*—Observed station is on sand and grass land about 4 feet above high water. It is on the north side of an overflow from the ocean, about 200 yards from Sinepuxent Bay and 120 yards west-northwest of sand dunes between the ocean and the station. Cement monument marking reference station is 10.32 meters N 52° 39' E of observed station. No other permanent reference objects near station.

*Marks.*—Observed station is nail in stub flush with ground. Reference station is center point of triangle on standard cement monument with top 4 inches above ground.

## ELLPOW.

*General locality.*—Western shore of Sinepuxent Bay, about  $\frac{1}{4}$  mile inland from what is known locally as Powell Point and about  $3\frac{1}{2}$  miles southwest of Ocean City. (See Chart No. 13.)

*Immediate locality.*—Observed station is on marshy grass land well back from bay, near a property line indicated by crab apple trees and a wire fence which runs from bay to crab apple trees and joins a snake fence. It is about  $\frac{1}{4}$  mile southeast of Hastings house, about  $\frac{1}{4}$  mile southwest of Kelley house, and about  $\frac{1}{4}$  mile northeast of Coffin Hotel (a large, unpainted, square house with four-sided roof). Cement monument marking reference station is 7.20 meters S  $83^{\circ} 50'$  W of observed station.

*Marks.*—Observed station is nail in pine stub flush with the ground. Reference station is center point of triangle on standard cement monument.

*References.*—

## LONGWELLS WINDMILL.

*General locality.*—Western side of Sinepuxent Bay, about ½ mile north by west from Sandy Point. (See Chart No. 13.)

*Immediate locality.*—Observed station is on tower in rear of house on "Longwell Farm."

*Marks.*—Observed station is center of windmill.

*References.*—None necessary.

## SANPOI.

*General locality.*—Western shore of Sinepuxent Bay, on Sandy Point. (See Chart No. 13.)

*Immediate locality.*—Observed station is on sage land 2 feet above high-water mark, about 80 yards west of extreme end of point, which is well rounded, 40 yards north of one shore of the point and 110 yards south of the other shore of the point. It is about 25 yards east-southeast of one end of a grove of crab-apple trees and about 110 yards south of the other end. Small bushes about 18 inches high surround station.

*Marks.*—Observed station is center point of triangle on standard cement monument.

## NORTH BEACH LIFE-SAVING STATION.

*General locality.*—Atlantic coast side of strip of beach land between lower Sinepuxent Bay and the ocean. (See Charts Nos. 13 and 14.)

*Immediate locality.*—Observed station is on lookout cupola on the North Beach Life-Saving Station. This cupola is a gable-roof structure on a gable-roof 2½-story house.

*Marks.*—Observed station is a black and white 4 by 4 inch pole secured temporarily to the exact middle of ridge of gable roof of lookout cupola.

*References.*—None necessary.

## BIRCH.

*General locality.*—Southern part of Sinepuxent Neck, between Sinepuxent Bay and Newport Bay, about ½ mile north-northwest of South Point. (See Charts Nos. 13 and 14.)

*Immediate locality.*—Observed station is on the northwest and higher of two knolls about 20 feet above high-water mark, 600 yards east of Island Point, 200 yards northeast of shore of upper Chincoteague Bay, 75 yards east-southeast of where a ditch and fence meet, and about 400 yards southwest of a house and barn.

*Marks.*—Observed station is center point of triangle on standard cement monument.

## NECK.

*General locality.*—Northeastern shore of Newport Bay, on easterly side of Newport Neck between Greys Inlet and Spence Cove. (See Chart No. 13.)

*Immediate locality.*—Observed station is on marsh land about 400 yards northeast of Knot Point, 100 yards north from shore of Spence Cove, 50 yards northwest of small marsh inlet, and 10 yards south of edge of a prominent grove of old oaks. There are bushes between the station and the oak grove. Cement monument marking reference station is 12.72 meters N 7° 23' W from observed station.

*Marks.*—Observed station is center point of triangle on standard cement monument. Reference station is center point of triangle on standard cement monument. (NOTE.—Top disconnected, but re cemented.)

## HANDYS HAMMOCK.

*General locality.*—Western shore of upper end of Chincoteague Bay and western side of entrance to Newport Bay on solid land partly surrounded by marsh known as Handys Hammock. (See Charts Nos. 13 and 14.)

*Immediate locality.*—Observed station is on a sand knoll about 10 feet above high water and 140 yards west-northwest from the extreme end of the narrow point on which it is situated. It is about 35 yards west of another short point, 30 feet south-southwest of shore at a sand beach, 20 yards north of a thorn bush and 50 yards north-northwest of a small pool 20 feet square.

*Marks.*—Observed station is center point of triangle on standard cement monument.

Green Run Inlet Life-Saving Station lookout	255	46		3½ miles.
Right end of Green Run Inlet woods	271	31		3½ miles.
Between two chimneys on cream-colored house	339			5½ miles.

TURNAGAIN.

*General locality.*—Eastern shore of Chincoteague Bay, on main land marsh about 1 mile southeast of Whittington Point. (See Charts Nos. 14 and 15.)

*Immediate locality.*—Observed station is on marsh land awash at high water, about 75 yards south from shore, 55 yards east from shore, and about 83 yards west from shore of a small bay. A creek runs nearly around this piece of marsh, but does not make an island of it. No permanent reference marks near station.

*Marks.*—Observed station is center point of triangle on standard cement monument.

*References.*—

## GREEN RUN INLET LIFE-SAVING STATION FLAGSTAFF.

*General locality.*—Atlantic coast, about 18 miles south-southwest of Ocean City and about 15 miles northeast by north of "Assateague Light." (See Charts Nos. 14 and 15.)

*Immediate locality.*—Observed station is detached flagstaff with a topmast belonging to Green Run Inlet Life-Saving Station.

*Marks.*—Observed station is center of flagstaff.

*References.*—None necessary.

## LANDLET.

*General locality.*—Western shore of Chincoteague Bay, about 2¼ miles south of Snow Hill Landing, on point of land known locally as Watermelon Point. (See Chart No. 14.)

*Immediate locality.*—Observed station is on a small sandy island surrounded by marsh land and about 20 yards west of shore. This so-called island is the only hard land on the marsh point and is about ⅓ mile to the east of the nearest solid land.

*Marks.*—Observed station is center point of triangle on standard cement monument buried with top 2 inches below surface of ground.

## MARYLAND-VIRGINIA LIFE-SAVING STATION BEACH).

*General locality.*—Atlantic coast near ocean beach, on boundary line between Maryland and Virginia and about 1/4 mile north-northeast of Pope Island Life-Saving Station. (See Chart No. 15.)

*Immediate locality.*—Observed station is on marsh and sand land about 230 yards northwest of high-water mark on beach, 75 yards west of top of sand dunes on inner edge of beach, and about 50 yards northwest of the Life-Saving Service telephone line which runs along the beach in midst of bushes at this point.

*Marks.*—Observed station is the center of an old granite monument (said to have been established many years ago) which marks the boundary between Maryland and Virginia. Top of monument is 6 by 6 inches square and projects 18 inches above the ground. The top is marked with an east-and-west line from corner to corner and the letters "M" and "V" to indicate the Maryland and Virginia sides of the boundary, respectively.

## MARYLAND-VIRGINIA (POPE ISLAND).

*General locality.*—Western side of Pope Bay on eastern side of Pope Island, about 1/4 mile north-east of its southern extremity and on boundary between Maryland and Virginia. (See Chart No. 15.)

*Immediate locality.*—Observed station is on hard land 3 feet above high-water mark, about 10 yards west of shore, 85 yards south of an old house, and 10 yards east of bushes.

*Marks.*—Observed station is the center of an old granite monument projecting 18 inches above ground which marks the boundary between Maryland and Virginia. Top of monument is cut in a square 6 by 6 inches with an east-and-west line from corner to corner and the letters "M" and "V" to indicate the Maryland and Virginia sides of the boundary, respectively.

## POPE ISLAND LIFE-SAVING STATION (VIRGINIA).

*General locality.*—Atlantic coast, on Pope Island Beach, about  $9\frac{3}{4}$  miles northeasterly from "Assateague Light." (See Chart No. 15.)

*Immediate locality.*—Observed station is on the main building of the Pope Island Life-Saving Station, which is a gable roofed  $1\frac{1}{2}$ -story wooden structure with a square lookout cupola. Pointed cap piece of cupola supports a weather vane in the form of a fish.

*Marks.*—Observed station is center of weather-vane spindle.

*References.*—None necessary.

## WILDCAT (VIRGINIA).

*General locality.*—Northerly end of Chincoteague Island, on westerly side of Assateague Bay. (See Chart No. 15.)

*Immediate locality.*—Observed station is on marsh land, about  $\frac{1}{4}$  mile south of upper end of island, known locally as Wildcat Point. It is inshore about 100 yards northwest of mouth of small marsh drain emptying into Assateague Bay. The marsh creek or drain makes a decided turn about 12 yards south of station.

*Marks.*—Observed station is center point of triangle on standard cement monument.

## ASSATEAGUE LIGHT (VIRGINIA).

*General locality.*—Southerly part of Assateague Island, seacoast of Virginia, about  $2\frac{1}{2}$  miles from its southwesterly point. (See progress map.)

*Immediate locality.*—Red tower, 154 feet above sea level and 129 feet above its own base, known as Assateague Light-House.

*Marks.*—Observed station is center of black lantern.

*References.*—None necessary.

## KILLICK SHOAL LIGHT (VIRGINIA).

*General locality.*—Southerly end of Chincoteague Bay, on Killick Shoals, off entrance of Chincoteague Channel. (See progress map.)

*Immediate locality.*—Screw pile structure known as Killick Shoal Light-House.

*Marks.*—Observed station is center of black lantern.

*References.*—None necessary.

## CHESTER (VIRGINIA).

*General locality.*—Southern and western shores of Chincoteague Bay, about  $\frac{1}{2}$  mile south of shore of bay and  $\frac{1}{4}$  mile east of solid land known locally as Mosquito Point Farm. (See progress map.)

*Immediate locality.*—Observed station is on a mound of dry land surrounded by marsh, known locally as Fox Hill. It is on the highest point and near the apex of the mound, which is V-shaped and about 15 feet above high water at the station. The mound gradually falls off to the level of the marsh from the station to the ends of the V, which are both about 150 yards distant, and at the extreme apex, which is about 25 yards to the north. Reference station is 5.82 meters N  $80^{\circ} 51'$  W of the observed station.

*Marks.*—Observed station is center of tile pipe surrounded by cement with top flush with ground. Reference station is center point of triangle on standard cement monument.

## LONG POINT (VIRGINIA).

*General locality.*—Western shore of lower Chincoteague Bay, near Long Point, about  $\frac{1}{2}$  mile east of Franklin City. (See Chart No. 15.)

*Immediate locality.*—Observed station is on marsh land about 40 yards from end of point of mainland, 30 yards southwest of shore and 20 yards north of shore. A small marsh island is located about 200 yards east of the station, which was once a part of the mainland and known as Long Point. Reference station is 11.81 meters N  $42^{\circ} 37'$  W of the observed station.

*Marks.*—Observed station is center of tile pipe set in cement with top flush with the ground. Reference station is center point of triangle on standard cement monument.

<i>References.</i> —	o	'	"

## GRACE M. E. CHURCH (VIRGINIA).

*General locality.*—Western shore of lower Chincoteague Bay, about  $\frac{1}{2}$  mile northwest of railway wharf at Franklin City. (See Chart No. 15.)

*Immediate locality.*—Observed station is the taller of two towers on church known as Grace M. E. Church.

*Marks.*—Observed station is center of pointed tower or spire.

*References.*—None necessary.

## MONEY (VIRGINIA).

*General locality.*—Western shore of lower Chincoteague Bay, about 1 mile west-northwest of Long Point, on northern edge of town of Greenbackville, and just south of Maryland-Virginia boundary. (See Chart No. 15.)

## Survey of Oyster Bars, Worcester County, Md.

*Immediate locality.*—Observed station is about 70 yards northeast of railway on a sandy rise of ground about 15 feet above level of track. It is about 25 yards south of the Maryland-Virginia boundary and 30.43 meters S 38° 28' E of broken stone boundary monument. At the station, "Assateague Light" shows almost tangent to third house north of Grace M. E. Church.

*Marks.*—Observed station is center point of triangle on standard cement monument buried with top 30 inches below surface of ground

*References.*—

## MARYLAND-VIRGINIA (RAILROAD).

*General locality.*—Western shore of lower Chincoteague Bay, inland about 1 mile west-northwest of Long Point, on boundary line between Maryland and Virginia. (See Chart No. 15.)

*Immediate locality.*—Observed station is about 80 yards northeast of railroad on a sandy rise of ground about 15 feet above level of track. It is on the edge of an excavation in this sand hill and is likely to be undermined any time by the carting away of sand for building purposes. The standard cement monument marking triangulation station "Money" is buried with its top 30 inches below surface of ground 30.43 meters S 38° 28' E true from station.

*Marks.*—Observed station is the center of a square-top granite monument projecting 18 inches above ground which marks the boundary between Maryland and Virginia. Top of monument when visited in December, 1907, was broken loose and resting on the undisturbed part of the stone buried in the ground. This top was cut in a square 6 by 6 inches with an east-and-west line from side to side and the letters "M" and "V" to indicate the Maryland and Virginia side of the boundary, respectively

*References.*—None observed.

## MILL.

*General locality.*—Western shore of Chincoteague Bay, on the northern part of Mill Island. (See Chart No. 15.)

*Immediate locality.*—Observed station is the highest point of the island, on a hill about 20 feet above high water which is located about ½ mile southwest of the upper end of the island. It is about 40 yards east by south of an abandoned house and sheds and about ¼ mile north of another abandoned house.

*Marks.*—Observed station is center point of triangle on standard cement monument.

## BOUNDARIES OF OYSTER BARS.

### EXPLANATION.

The law of the United States authorizing the cooperation of the Department of Commerce and Labor in the survey of natural oyster bars of Maryland provides for the designation and employment by the Department of Commerce and Labor of such officers, experts, and other technically qualified persons "as may be necessary to cooperate with the Maryland State Board of Shell Fish Commissioners in making a survey of and locating the natural oyster beds, bars, and rocks in the waters within the State of Maryland." The oyster laws of Maryland provide that the Maryland Shell Fish Commissioners, with the aid of such persons as may be designated by the Government, shall proceed "to have laid out, surveyed, and designated on the said charts the natural beds and bars, and shall cause to be marked and defined as accurately as practicable the limits and boundaries of the natural beds, bars, and rocks as established by said survey, and they shall take true and accurate notes of said survey in writing, and make an accurate report of said survey, setting forth such a description of landmarks as may be necessary to enable the said board, or their successors, to find and ascertain the boundary lines of the said natural oyster beds, bars, and rocks, as shown by a delineation on the maps and charts." The oyster laws of Maryland also provide in another section that there shall "be made a true and accurate survey of the natural oyster beds, bars, and rocks \* \* \* with reference to fixed and permanent objects on the shore, giving courses and distances, to be fully described and set out in a written report of said survey."

Under the provisions of the laws quoted above the State of Maryland, in cooperation with the Department of Commerce and Labor, must define the boundaries of the natural oyster bars "as accurately as practicable" and also "with reference to fixed and permanent objects on the shore, giving courses and distances." The requirement of "as accurately as practicable" is easily fulfilled by definition of the location of the corners of the oyster bars by latitude and longitude. In fact, this method is probably the most satisfactory and accurate one that could be used for all purposes of legal definition or for relocation of the oyster-bar boundaries by competent engineers. Therefore the additional requirement of "giving courses and distances" is superfluous and is only fulfilled in the published definitions on account of the specific provisions of the law making it compulsory. This part of the description of boundaries has involved an immense amount of extra computations in order to prevent technical discrepancies between the latitude and longitude of a corner of an oyster bar and its distance and bearing from objects on shore of known latitude and longitude without adding anything to the accuracy and very little to the convenience of practical use of the descriptions of the oyster-bar boundaries.

As provided by law the boundaries of the oyster bars are all straight lines, but in the work already completed they have inclosed areas of all shapes from triangles to complicated 14-sided figures, and of all sizes from 4 acres to 7,548 acres. The sides

have varied in length from 93 to 7,529 yards, and in some cases the corners of the boundaries have been practically at the triangulation stations from which they are located, while in other instances they were over 13,600 yards from the landmarks most available for the purpose of fixing their position.

The varied characteristics of the legal boundaries of the oyster bars indicated by the above statement, together with the complicated requirements of the law under which the survey has been made and the magnitude of the work with the consequent need of fixed and uniform methods, have made the problem of describing the boundaries one of considerable difficulty and great importance.

The boundaries of the oyster bars of Maryland, as established by the Shell Fish Commission and delineated on the Coast and Geodetic Survey charts and projections and on the leasing charts of the Commission, are technically defined and described by a method somewhat different from that used in other oyster surveys. But it is believed that the forms finally adopted will fulfill all needs of the survey for both the present and future.

#### METHOD OF DESCRIBING BOUNDARIES.

The descriptions have been arranged in tabular form, thus avoiding many hundred repetitions of the same words by making one explanation of the tables sufficient for all oyster bars in each county.

*Title.*—At the top of each tabular form is given the legal name of the oyster bar to be described, and the one by which it is known and designated in the published oyster records and on the oyster charts. The adopted name of the oyster bar is the one used locally, as nearly as could be ascertained by the hydrographic engineer of the Commission; and when there was no local name in common use a name was selected from one of the prominent features of the vicinity that would naturally suggest the section of the waters where the oyster bar was located.

Underneath the name, in parentheses, is given the general locality of the oyster bar and the serial number of the "Maryland Oyster Chart" on which its legal boundaries are shown.<sup>a</sup>

*First column.*—This column, under the heading of "Corner of bar," gives the number corresponding to the corner of the boundary as shown on the charts and to the number on the buoy marking the actual corner of the bar. The numbers of the corners have been assigned by naming the southernmost point No. 1, thence proceeding in a clockwise direction around the bar; but where a corner of one oyster bar is identical with the corner of the boundaries of one or more other oyster bars only the number of the corner of the oyster bar being described in the table is given in this column.

*Second and third columns.*—These two columns, under the headings of "Latitude" and "Longitude," give the geographic positions of the corners. These positions have been adopted by the Commission as the primary technical definition of the location of the corners, and should be considered as final in case of a dispute arising from discrepancies caused by other means of location. The latitudes and longitudes given in these columns are based on the United States standard datum of the Coast and Geodetic Survey, and the points thus defined can be relocated from distant triangulation stations

<sup>a</sup> These charts can be obtained by application to the Superintendent of the Coast and Geodetic Survey at Washington, D. C.

of the Survey, even though all the landmarks and buoys originally used for their location have been destroyed by natural or other causes.

*Fourth and fifth columns.*—These two columns, under the general heading of "True bearing"<sup>a</sup> and the specific headings "Forward" and "Back," give bearings measured from a true north-and-south line. The three "Forward" bearings are from the corner of the boundary designated in the first column to the triangulation stations named on the corresponding lines in the last column, and the three "Back" bearings are from these same stations in the last column to the corresponding corner of boundary in the first column. The difference in minutes of arc between the forward and back bearings shown in some cases is actual and not accidental, and is due to the fact that the computations took into account the spheroidal shape of the earth.

*Sixth column.*—This column, under the heading of "Distance," gives the three computed distances in yards from the corner of the bar noted in the first column to the three triangulation stations named on the corresponding lines in the last column, and vice versa.

*Seventh column.*—This column, under the heading of "U. S. C. & G. S. triangulation station,"<sup>b</sup> gives the names of the landmarks from which were computed the corresponding "Latitude," "Longitude," "True bearing," and "Distance" of the "Corner of the bar" designated in the first column. A full description of the location and markings of these triangulation stations is given in another part of this publication under the heading of "Descriptions of triangulation stations."

#### SURVEYING METHODS FOR RELOCATION OF BOUNDARIES.

There are a number of methods that can be used in the relocation of the actual boundaries of the natural oyster bars as technically described in this publication and delineated on the published charts of the Coast and Geodetic Survey and the leasing charts of the Shell Fish Commission.

The following brief descriptions of five of these more or less different methods assume a certain amount of experience and knowledge on the part of the engineer in the particular kind of surveying under consideration, and are only intended as reminders of ways and means that can be used.

There are two problems that are likely to present themselves to those interested in the boundaries of natural oyster bars: One, to determine whether the buoys marking the corners have been dragged or otherwise moved from their correct positions, and the other, to relocate or reestablish a buoy at the point from which it was removed. The different ways of solving these two problems partly depend upon the instruments possessed by the engineer and his assistants and partly on his training and experience.

(1) *Triangulation.*—This method is the one that will give the greatest accuracy, but on account of its requiring special data and instruments, and being an operation rarely used by engineers not engaged in geodetic surveying, it is recommended only for cases in dispute that can not be settled satisfactorily by some other method. An explanation of this class of work would be too long for a report of this sort, and those

<sup>a</sup> The mean magnetic variation for Worcester County was  $5^{\circ} 55'$  west of north in 1909 and increasing at the rate of  $3\frac{1}{2}'$  yearly.

<sup>b</sup> Geographic positions of these triangulation stations can be obtained by application to the Superintendent of the Coast and Geodetic Survey, Washington, D. C.

not familiar with this method are referred to the publications on the subject by the Coast and Geodetic Survey.

(2) *Hydrographic*.—This method is the most simple and satisfactory one that can be adopted if the surveyor can obtain the use of the necessary instruments and assistants. It is the one best suited for the work of the engineers of the Commission in relocating corners of boundaries, as it gives results of the accuracy ordinarily required and is rapid in execution. Besides, it has the advantage of being available whenever three triangulation stations of suitable relative positions are visible from the offshore points needing relocation.

Most navigators and others familiar with the use of a sextant are well acquainted with the graphic three-point method of fixing a position on water, and only a brief description of the operation will be stated.

In the case where there is only one engineer having a single sextant, the three-point method can be used if the two angles determining the position of a buoy are first derived from the "Forward" bearings given in the tabular forms describing the boundaries of the oyster bars. For example, take "South Point" bar, which is the first one described in this publication, and assume that "Corner No. 3," is to be examined as to its position. The angle between the two landmarks "Birch" and "Neck" as determined from right to left from the forward bearings from this corner is  $59^{\circ} 11'$  and the angle between "Neck" and "Newport" is  $49^{\circ} 44'$ . Having these two angles, the engineer proceeds to the buoy of doubtful location and measures the actual sextant angles between the landmarks for which the calculations were made. If the measured and calculated angles do not agree the buoy is not in its correct position and the boundary corner must be relocated. This is accomplished by moving the boat about until a point is reached where the angles do agree, and this point being the desired location, the buoy can be placed in its correct position.

If the engineer can obtain the use of both a sextant and a three-arm protractor ("position finder"), the availability of the hydrographic method is increased, as the use of the protractor is essential in case of the washing away or destruction of one or more of the landmarks originally used in describing the boundaries. Under these circumstances, any three landmarks of suitable relative position that are visible from the point to be located can be utilized. For example, the engineer can proceed to the buoy of doubtful position and measure the two adjacent sextant angles between the three landmarks selected. These two angles are set off on the three-arm protractor and the actual position of the buoy plotted on the chart by shifting the protractor about until the edge of each of the three arms passes through the center of the symbols on the chart marking the position of the three landmarks selected. The center of the hub of the protractor will indicate on the chart the actual position of the buoy, and if the point thus obtained does not coincide with the true position of the corner of the boundary as given on the chart, the surveyor can proceed to locate the buoy correctly by reversing the operation. This is done by placing the center point of the hub of the protractor over the corner of the boundary in question and measuring on the chart the two adjacent protractor angles between the three selected landmarks. One of the angles thus obtained is set on the sextant and the boat moved about until the two landmarks are shown by the sextant to subtend the same angle obtained from the

protractor. The second angle is then placed on the sextant and the same operation gone through, and so on, first using one angle on the sextant then the other until a point is reached where both observed sextant angles are practically identical with the protractor angles. The point thus located is the desired one and the buoy can be placed to mark the true position of the corner of the boundary in question.

If the engineer possesses two sextants and a protractor, this problem is far easier of solution, as the two angles can be set off on separate sextants and the observer can quickly find the desired point where they agree with the protractor angles by using one sextant after the other without the need of resetting either.

If there are two observers, two sextants, and a protractor, it can be seen that the best conditions for both rapid and accurate hydrographic locations of points are attained; in fact, this is the method by which the buoys at the corners of the boundaries were originally placed by the hydrographic engineer to the Commission.

(3) *Magnetic bearings from offshore.*—This method of fixing a position on water is a simple and well-known one in navigation. It is available to anyone having a boat compass and will be of special use to the State fishery force in investigating cases where buoys are supposed to have been moved for illegal purposes.

In the case where a buoy is supposed to have been moved from its true position the observer takes compass bearings to the three landmarks given in the last column of the tables opposite the boundary corner in question. These bearings are then corrected for the local declination,<sup>a</sup> and if the results agree with the published bearings the buoy is correctly located.

In the case where the buoy is not in its correct position, or has disappeared altogether, the desired point can be determined by maneuvering the vessel until the corrected bearings agree with the ones in the tabular descriptions, when the buoy can be anchored in its proper location.

In the case where the landmarks for which the bearings are published have been destroyed or washed away, any landmarks whose positions are indicated on the charts can be used by getting their bearings directly from the chart by parallel rulers or a protractor and then applying them in the same manner as the ones published in the tables.

(4) *Magnetic bearings from shore.*—This method will be of special value to engineers having an ordinary surveyor's compass. The compass can be set over the point marking a "triangulation station" on shore, the name of which is given in the last column opposite the "corner" in question. The instrument is then set at the corresponding "back" bearing (corrected for local magnetic declination) given in the fourth column of the tables opposite the "corner" in question, and the direction thus determined will give one range on which the desired point must be located. The compass can then be moved to a second triangulation station and another range located in a similar manner. The intersection of these two range lines will give the desired point; but in general it should be checked by an additional range line determined from a third station.

(5) *Horizontal angles measured at landmarks.*—This process is a modification of the triangulation method, and will be useful to engineers who have a transit and desire considerable accuracy.

---

<sup>a</sup> The mean magnetic variation for Worcester County is 5° 55' west of north in 1909 and increasing at the rate of 3½' yearly.

The instrument is placed over a "triangulation station," the name of which appears in the last column of the tabular description opposite the "corner" in question. The telescope is then pointed to the landmark indicated in the "Descriptions of landmarks" as having a direction of  $0^{\circ} 00' 00''$  from the triangulation station being occupied by the transit. The tabular description of the boundaries is next examined and the "back" bearing of the questionable boundary "corner" from the landmark being occupied is taken out. The angle calculated from this "back" bearing and the bearing given in parentheses alongside the zero landmark in the "Descriptions of landmarks" is then set off on the transit, and a range line established on which the desired point must be located. A similar process is then carried on at a second station, and so on until the position of the buoy is satisfactorily fixed.

## APPENDIXES.

---

### APPENDIX A.—LAWS RELATING TO THE COOPERATION OF THE COAST AND GEODETIC SURVEY AND BUREAU OF FISHERIES WITH THE MARYLAND SHELL FISH COMMISSION.

The work of the Coast and Geodetic Survey and of the Bureau of Fisheries, in cooperation with the Maryland Shell Fish Commission, in surveying the oyster bars, establishing permanent landmarks at triangulation stations, and preparing for publication the necessary charts and technical and legal descriptions of boundaries and landmarks shown on these charts, has been executed in compliance with a request from the governor of the State of Maryland to the Secretary of Commerce and Labor, and by the authority of the following laws of the United States and Maryland:

[Act of Congress approved May 26, 1906.]

AN ACT To authorize the Secretary of Commerce and Labor to cooperate, through the Bureau of the Coast and Geodetic Survey and the Bureau of Fisheries, with the shellfish commissioners of the State of Maryland in making surveys of the natural oyster beds, bars, and rocks in the waters within the State of Maryland.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the Secretary of Commerce and Labor be, and he is hereby, authorized and directed, upon the request of the governor of the State of Maryland, to designate such officers, experts, and employees of the Bureau of the Coast and Geodetic Survey and of the Bureau of Fisheries as may be necessary to cooperate with the Maryland State board of shellfish commissioners in making a survey of and locating the natural oyster beds, bars, and rocks in the waters within the State of Maryland; and the Secretary of Commerce and Labor is hereby authorized and directed to furnish to the officers, experts, and employees of said Bureaus so detailed as aforesaid such instruments, appliances, and steam launches as may be necessary to make the survey aforesaid; and the Secretary of Commerce and Labor is hereby authorized to have made in the Bureau of the Coast and Geodetic Survey all the plats necessary to show the results of the aforesaid survey and the locations of the said natural oyster beds, bars, and rocks in the waters within the State of Maryland, and to furnish to the board of shellfish commissioners of the State of Maryland such copies as may be necessary, and for this purpose to employ, in the District of Columbia and elsewhere, such technically qualified persons as may be necessary to carry out the purpose of this act.

SEC. 2. That the Secretary of Commerce and Labor is hereby further authorized to have erected or constructed by the officers so detailed as aforesaid, while making such survey, such structures as may be necessary to mark the points of triangulation, so that the same may be used for such future work of the Coast and Geodetic Survey as the said Bureau may be hereafter required to perform in prosecuting the Government coast survey of the navigable waters of the United States located within the State of Maryland.

\* \* \* \* \*

SEC. 4. That this act shall take effect from the date of its passage.

*Survey of Oyster Bars, Worcester County, Md.*

[Act of Congress approved June 30, 1906.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and seven, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and seven, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including the expenditures authorized under Public Act Numbered One hundred and eighty-one, approved May twenty-sixth, nineteen hundred and six, and contingent expenses incident thereto, five thousand dollars, together with the unexpended balance under this appropriation for nineteen hundred and six and prior years which is hereby reappropriated and made available on this account for the fiscal year nineteen hundred and seven. \* \* \*

[Act of Congress approved March 4, 1907.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and eight, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and eight, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, to be immediately available and to continue available until expended, twenty-five thousand dollars. \* \* \*

[Act of Congress approved May 27, 1908.]

AN ACT Making appropriations for sundry civil expenses of the Government for the fiscal year ending June thirtieth, nineteen hundred and nine, and for other purposes.

*Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That the following sums be, and the same are hereby, appropriated, for the objects hereinafter expressed, for the fiscal year ending June thirtieth, nineteen hundred and nine, namely: \* \* \*

COAST AND GEODETIC SURVEY: \* \* \* For any special surveys \* \* \* including expenses of surveys in aid of the shellfish commission of the State of Maryland, which expenses, including cost of plats and charts, shall not exceed fifteen thousand dollars in any one year, to be immediately available, twenty thousand dollars.

[Act of the legislature of Maryland approved April 2, 1906.]

AN ACT To establish and promote the industry of oyster culture in Maryland, to define and mark natural oyster beds, bars and rocks lying under the waters of this State, to prescribe penalties for the infringement of the provisions of this Act, and \* \* \*

SECTION 1. *Be it enacted by the General Assembly of Maryland,* That the following sections be, and they are hereby, added to Article 72 of the Code of Public General Laws, title "Oysters." \* \* \*

SEC. 86. The Board of Shell Fish Commissioners shall, as soon as practicable after the passage of this Act, cause to be made a true and accurate survey of the natural oyster beds, bars and rocks of this State, said survey to be made with reference to fixed and permanent objects on the shore, giving courses and distances, to be fully described and set out in a written report of said survey, as hereinafter required. A true and accurate delineation of the same shall be made on copies of published maps and charts of the United States coast and geodetic survey, which said copies shall be filed in the office of the said commissioners in the city of Annapolis; and the said commissioners shall further cause to be

delineated upon copies of the published maps and charts of the United States coast and geodetic survey, of the largest scale, one copy for each of the counties of this State in the waters of which there are natural oyster beds, bars and rocks, all natural beds, bars and rocks lying within the waters of such county, which maps shall be filed in the offices of the clerks of the Circuit Court for the respective counties wherein the grounds so designated may lie. \* \* \*

SEC. 87. The Governor of this State is hereby requested to ask the assistance of the United States coast and geodetic survey, and of the United States Fish Commissioner, to aid in the carrying out of the provisions of the preceding section.

\* \* \* \* \*

SEC. 89. As soon as practicable after the first day of April, 1906, the said commissioners shall organize, and shall at once proceed, with the assistance of such person or persons as may be detailed by the United States coast and geodetic survey, and the United States Fish Commissioner, to aid them in their work, and of such persons as may be appointed under the preceding section, to have laid out, surveyed and designated on the said charts, the natural beds and bars, and shall cause to be marked and defined as accurately as practicable, the limits and boundaries of the natural beds, bars and rocks, as established by said survey, and they shall take true and accurate notes of said survey in writing, and make an accurate report of said survey, setting forth such a description of landmarks as may be necessary to enable the said board, or their successors, to find and ascertain the boundary lines of the said natural oyster beds, bars and rocks, as shown by a delineation on the maps and charts provided in this Act; said report shall be completed and filed in the office of the board in the city of Annapolis within ninety days after the completion of the survey of any county. Said commissioners shall cause the same to be published in pamphlet form, and transmit copies of the same to the clerks of the Circuit Court for the respective counties, where the charts have been filed or directed to be filed as hereinafter provided; the said report to be filed by the clerks of the several counties in a book kept for that purpose. And the said survey and report, when filed, subject to the right of appeal hereafter provided for in this Act, shall be taken in all of the courts of this State as conclusive evidence of the boundaries and limits of all natural oyster beds, bars and rocks, lying within the waters of the county wherein such survey and report are filed, and shall be construed to mean in all of the said courts that there are no natural oyster beds, bars or rocks lying within the waters of the counties wherein such report and survey are filed, other than those embraced in the survey authorized by this Act, and that all areas of the Chesapeake Bay and its tributaries within the State of Maryland, not shown in the survey to be natural oyster beds, bars or rocks shall be construed in all the courts of the State to be barren bottoms, and open for disposal by the State for the purpose of private planting or propagation of oysters thereon under the provisions of this Act; provided, that the said survey and report shall not be construed as to affect in any manner the holdings by citizens of this State in any lot which may have been appropriated or taken up under the laws of this State prior to the approval of this Act.

The law of the State of Maryland, passed March 9, 1842, authorizing officers of the United States Coast and Geodetic Survey to enter upon the lands within the State limits for the purposes of the Survey, is as follows:

AN ACT Concerning the Survey of the Coast of Maryland.

SECTION 1. *Be it enacted by the General Assembly of Maryland*, That it shall and may be lawful for any person or persons employed under and by virtue of an act of the Congress of the United States, \* \* \* at any time hereafter to enter upon lands within this State for the purpose of exploring, surveying, triangulating, or levelling, or doing any other matter or thing which may be necessary to effect the objects of said act, and to erect any works, stations, buildings, or appendages requisite for that purpose, doing no unnecessary injury to private or other property.

SEC. 2.<sup>a</sup> *And be it enacted*, That in case the person or persons employed under the act of Congress aforesaid, can not agree with the owners or possessors of the land so entered upon and used as to the

<sup>a</sup> Under the rulings of the Comptroller of the Treasury no damages can be collected except through the United States Court of Claims unless an agreement has been made in advance.

amount of damage done thereto by reason of the removal of fences, cutting of trees or injury to the crop or crops growing on the same, it shall and may be lawful for the said parties or either of them to apply to the chief justice for the time being or one of the associate judges of the judicial district in which such land may be situated, who shall thereupon appoint three disinterested and judicious freeholders, residents of the same judicial district, to proceed with as much despatch as possible to the examination of the matter in question, and the faithful assessment of the damages sustained by the owners or possessors aforesaid, and the said freeholders or a majority of them, having first taken and subscribed an oath or affirmation before the chief or associate justice aforesaid or other person duly authorized to administer the same, that they will well and truly examine and assess as aforesaid, and having given five days' notice to both parties of the time of their meeting, shall proceed to the spot, and then and there upon their own view and if required, upon the evidence of witnesses, (to be by them sworn or affirmed and examined) shall assess the said damages, and shall afterward make report thereof and of their proceedings in writing under their hands and seals and file the same within five days thereafter in the office of the clerk of the county in which the land aforesaid is situated, subject to an appeal by either party to the county court of the said county within ten days after filing as aforesaid, and the said report so made as aforesaid, if no appeal as aforesaid be taken, shall be held to be final and conclusive as between the said parties, and the amount so assessed and reported shall be paid to the said owners or possessors of the land so damaged within twenty days after the filing of said report, and the said chief or associate justice as aforesaid, shall have authority to tax and allow upon the filing of said report, such costs, fees and expenses to the said freeholders for the performance of their duty as he shall think equitable and just, which allowance shall be paid by the person or persons employed under the act of congress aforesaid, within the time last above limited, but if an appeal as aforesaid be taken, the case shall be set down for hearing at the first term of county court aforesaid, ensuing upon and after appeal, and it shall be lawful for either party immediately after the entry of such appeal, to take out summons for such witnesses as may be necessary to be examined upon the hearing aforesaid, and the said court shall have power in its discretion to award costs against which ever the final judgment shall be entered, and such appeal at the option of either party may and shall be heard before and the damage assessed by a jury of twelve men to be taken from the regular panel and elected as in other cases.

SEC. 3. *And be it enacted*, That if any person or persons shall wilfully injure or deface or remove any signal, monument or building or any appendage thereto, erected, used or constructed under and by virtue of the act of congress aforesaid, such person or persons so offending shall severally forfeit and pay the sum of fifty dollars with costs of suit to be sued for and recovered by any person who shall first prosecute the same before any justice of the peace of the county where the person so offending may reside, and shall also be liable to pay the amount of damages thereby sustained, to be recovered with costs of suit in an action on the case, in the name and for the use of the United States of America, in any court of competent jurisdiction.

#### APPENDIX B.—THE HAMAN OYSTER CULTURE LAW.

[Extract from Second Report of Shell Fish Commission.]

##### OBJECT.

"The legislature in placing chapter 711 of the acts of 1906, better known as the Haman Oyster Culture Law, upon the statute books of Maryland had a twofold object in view:

1. To encourage an industry in oyster culture upon the *barren bottoms* beneath the tidewaters of the State.

2. To prevent the leasing of *natural oyster bars* for the purpose of oyster culture."

##### SURVEY.

"To make the leasing of barren bottoms possible and the leasing of natural bars impossible, provision was made for a survey of the natural bars for the purpose of accurately locating and marking the same. It was definitely provided that no barren bottoms should be leased in any part of the State until the natural bars of that region had been surveyed, charted, and marked with buoys."

## DEFINITION OF A NATURAL OYSTER BAR.

## NATURAL BAR NOT DEFINED.

"The Shell Fish Commission is instructed by section 90 of the Haman Oyster Culture Law to exercise its judgment liberally in favor of the natural bars when surveying, charting and buoying them, but other than this the Commission is uninstructed in this important matter. The responsibility of defining a natural bar is placed upon the Commission."

## DIVERSITY OF OPINION.

"No definition of a natural oyster bar could be formulated by any man or body of men which would meet with the approval of all parties concerned. Oystermen, as a rule, hold that all bottoms where oysters grow or have grown naturally even though now practically barren of oysters should be considered natural bars. Other citizens of the State who are not directly interested in the oyster business, but interested in the oyster industry from the standpoint of revenue, hold, as a rule, that no bottoms should be excluded from leasing for oyster culture which, by methods known to oyster culturists, may be made to yield a greater number of oysters than they now produce."

"It should be evident to every one that neither of these definitions could be adopted by the Commission as a working basis for determining which of the grounds surveyed are natural oyster bars."

## THE GOLDSBOROUGH DEFINITION.

The definition of a natural oyster bar which very nearly approaches a reasonable and satisfactory compromise between the views of the subject held by *oystermen* on one hand and by *oyster culturists* on the other is that contained in an opinion rendered by Judge Charles F. Goldsborough in the circuit court for Dorchester County in the July term, 1881, in the case of William T. Windsor and George R. Todd v. Job T. Moore.

This definition has been adopted by the Shell Fish Commission as the basis for the determination of the status of the various oyster bottoms surveyed and is as follows:

What then is a natural bar or bed of oysters? It would be a palpable absurdity for the State to attempt to promote the propagation and growth of oysters and to encourage its citizens, by a grant of land, to engage in their culture, if the lands authorized to be taken up were only those upon which oysters do not and can not be made to grow. That there may be lands covered by water in the State where no oysters can be found, but where, if planted, they could be cultivated successfully, may be possible, but, if so, I imagine that their extent must be too limited for them to be of much practical, general advantage for the purposes of such a law as the one under discussion; but there are thousands of acres of hard and shifting sands where oysters not only are not found, but where it would be folly to plant them; and these latter it can not be supposed that the State intended to offer to give away, for the simple reason that the State could not help knowing that nobody would have them.

Upon the other hand there are large and numerous tracts where oysters of natural growth may be found in moderate numbers, but not in quantities sufficient to make it profitable to catch them, and yet where oysters may be successfully planted and propagated. In my opinion these can not be called natural bars or beds of oysters, within the meaning of the Act of Assembly, and it is just such lands as these that the State meant to allow to be taken up under the provisions of the above-mentioned section of the Act.

But there is still another class of lands where oysters grow naturally and in large quantities and to which the public are now and have been for many years in the habit of resorting with a view to earning a livelihood by catching this natural growth, and here, I think, is the true test of the whole question. Land can not be said to be a natural oyster bar or bed merely because oysters are scattered here and there upon it, and because if planted they will readily live and thrive there; but whenever the natural growth is so thick and abundant that the public resort to it for a livelihood, it is a natural oyster bar or bed and comes within the above-quoted restriction in the law, and can not be located or appropriated by any individual.

## APPLICATION OF DEFINITION.

Before this definition may be of use in determining, accurately and scientifically, the status of an oyster ground, its central idea, "livelihood," must be expanded into accurately determinable factors, and these factors must be combined into a practical scheme of investigating the condition of the ground under consideration.

Stated briefly, a *livelihood* is represented by a *sum of money* obtained from the sale, at a fixed *price*, of a certain *quantity of oysters* gathered in a given *time* from an allotted *area* of ground.

Knowing the value of each of these factors it becomes possible to calculate the number of oysters an oyster ground must produce per square yard in order that oystermen may secure a livelihood by working upon it.

NOTE.—The factors into which the Commission resolved the livelihood problem, the value assigned to each factor, and the scheme devised for practical use in examining and applying the definition to oyster bottoms are given in outline in their Second Report under the heading of the preceding extract, and in detail in their First Report on pages 32 to 69.

APPENDIX C.—SUMMARY OF THE PARTICULAR SURVEYING OPERATIONS WHICH CONSTITUTE AN "OYSTER SURVEY" AS NOW BEING CARRIED ON IN MARYLAND.

*Explanation.*—A brief account of the particular surveying operations which constitute an "oyster survey" as now being carried on in Maryland will assist in the interpretation of records contained in the technical part of this report, and will be of interest to many who may not understand the necessity for the great amount of work being done or its complicated character.

To those familiar with methods used in surveying and charting the characteristic features of large bodies of water there is an evident necessity for the various operations performed, especially when it is known that the boundaries of the public oyster bars and of the private lots leased for purposes of oyster culture must be surveyed and charted with the greatest practical accuracy. To others it will be sufficient to state that the actual experience gained from oyster surveys in other States has proven that in order to avoid endless dissatisfaction and litigation it is necessary to accurately locate and permanently establish oyster boundaries as is now being done in Maryland.

*Triangulation survey.*—Such refinement of survey work as that demanded by the conditions of an oyster survey when carried on at considerable distances offshore can only be obtained by the use of a system of triangulation as a frame work or foundation. Therefore, a triangulation survey including the permanent marking of the positions of landmarks with monuments and a record of the descriptions of their locations for future recovery is a necessary operation of a complete oyster survey.

*Topographic survey.*—The technical records which establish the relation between the offshore oyster boundaries and triangulation landmarks are sufficient for the requirements of engineers in making resurveys, but do not supply the needs of others who are interested in the same boundaries by reason of their occupation as oystermen concerned as to the public oyster bars, or oyster culturists concerned as to the leaseable bottoms. For these it is necessary to have the charts of the survey show the relation of the shore line and other topographic features to the boundaries of the public oyster bars and private oyster farms. Therefore, a topographic survey is a necessary operation of a complete oyster survey.

*Hydrographic survey.*—In the settlement of the important question of what is, or what is not, a natural oyster bar, and in the consideration of bottoms to be selected for purposes of oyster culture, information as to the depth of water and the character of the bottom is required. Therefore, a hydrographic survey is a necessary operation of a complete oyster survey.

*Necessary foundation for an oyster survey.*—Consequently, the necessary components of a satisfactory foundation for a complete oyster survey are the three classes of survey operations technically named triangulation, topography, and hydrography, or, stated in another way, the foundation of a practical oyster survey includes the surveying operations usually followed by the Coast and Geodetic Survey leading up to the preparation and publication of nautical charts.

*Special surveys and investigations pertaining to oysters.*—Having obtained this cartographic survey for a foundation, partly by new work and partly from records of previous work of the Government, the combined operations<sup>a</sup> making up an "oyster survey" are completed by superimposing on this foundation special surveys and investigations pertaining particularly to oysters or other shell fish.

The special surveys pertaining to oysters furnish information as to the location and outline of oyster-shell bottoms, and are carried on by the sounding boat party in addition to the usual hydrographic work.<sup>b</sup> This operation consists of the observation and record of the character of vibration of a wire and chain apparatus which is dragged over the bottom, the vibrations or lack of vibrations indicating the presence and quantity of shells or absence of shells.

<sup>a</sup> See Appendix D of this publication for "Statistics of results of combined operations of the Government and State."

<sup>b</sup> See pages 104 to 123 of "First Annual Report of Maryland Shell Fish Commission."

The special oyster investigations<sup>a</sup> consist of the actual determination of the kind and quantity of oysters on the bottom, and such economic and biological studies of the supply of oyster food, density of water, character of the bottom, and other important matters as affect the growth of oysters. In this work the oyster investigation stations are located and buoyed by the hydrographic party while engaged in the survey of the oyster-shell limits. They are selected with the view of obtaining characteristic data which can be used for the interpretation of the recorded vibrations of the chain apparatus at all other points covered by the survey.

*Preparation of results.*—The actual surveying operations and oyster investigations having been completed for any one county, there still remains technical work of nearly equal magnitude to that described.<sup>b</sup> This work consists of the preparation of charts and technical descriptions of boundaries and landmarks for publication by the Government, the preparation of that part of the annual report of the Commission covering the special oyster surveys and investigations, the making of the leasing charts and finished projections, and finally the filing of the oyster charts and records with the courts and the Commission, thus opening a county for oyster culture.

*Summary.*—From the foregoing account it can be seen that a complete oyster survey properly conducted so as to answer all practical requirements of the present and permanency of results for the future is a very complicated affair, involving many lines of surveying and other scientific work, and requiring the professional services of experts in the various operations of cartographic surveying and shell-fish investigations.

APPENDIX D.—STATISTICS OF RESULTS OF THE COMBINED OYSTER SURVEY OPERATIONS OF THE GOVERNMENT AND STATE.<sup>c</sup>

Operations	Anne Arundel County <sup>d</sup>	Somerset County <sup>d</sup>	Wicomico County <sup>d</sup>	Worcester County <sup>d</sup>	Total
Natural oyster bars surveyed and delineated	91	37	15	28	171
Acres of natural oyster bars	33,666	27,566	2,038	1,655	64,925
Crab bottoms surveyed and delineated		54			54
Acres of crab bottoms		32,108			32,108
Clam beds surveyed and delineated		3			3
Acres of clam beds		506			506
Boundary buoys located and planted	362	154	53	108	677
Triangulation landmarks established	123	86	30	48	287
Miles of shore line covered by triangulation	110	125	46	95	360
Square miles of water covered by triangulation	220	375	44	110	730
Miles of examination of shell bottom with chain apparatus	369	296	58	63	786
Oyster investigation stations occupied	440	679	162	147	1,428
Tide stations established	4	3	1	1	9
Number of soundings over shell bottoms	37,049	17,904	3,387	3,649	61,989
Square miles covered by soundings and chain apparatus	58	47	3	3	111
Projections prepared and plotted	9	13	2	5	28
Leasing charts prepared	13	12	2	3	30
Oyster charts published	4	6	2	3	15
Reports published	2	2	2	2	8
Progress maps published	2	2	2	2	8

<sup>a</sup> See pages 30 to 67 and 129 to 199 of "First Annual Report of Maryland Shell Fish Commission."

<sup>b</sup> No mention is made here of the large amount of administrative work of the Commission, which is greatly complicated and increased by the effect of the oyster-survey operations on many thousands of people whose interests are more or less involved; or of the large amount of survey work involved in the survey and record of the boundaries of oyster lots leased from the State by private individuals for the purposes of oyster culture.

<sup>c</sup> These statistics do not include the large amount of triangulation, topography, and hydrography resulting from previous work of the Coast and Geodetic Survey which was utilized in the preparation of the published oyster charts and records.

<sup>d</sup> Work in Calvert, St. Marys, and Charles counties has been finished, but final statistics of results will not be published until these counties are opened for oyster culture.

<sup>e</sup> Total area of natural oyster bars of Connecticut is 5,770 acres.

<sup>f</sup> Less quantities covered by statistics of more than one county.
